APR 28 2010

The Honorable Daniel K. Inouye
Chairman, Committee on Appropriations
United States Senate
Washington, DC 20510

Dear Mr. Chairman:

As requested in the Explanatory Statement for the Omnibus Appropriations Act, 2009, the Federal Aviation Administration is pleased to provide the Safety Attribute and Element Performance Inspections Report.

The FAA was asked to provide semi-annual reports to the House and Senate Appropriations Committees that list all overdue safety attribute and element performance inspections and provide a target date of their completion. Safety attribute and element performance inspections are components of performance and design inspections. They are not isolated and do not have their own dates for completion. Therefore, we have provided additional information on comprehensive inspections. These comprehensive inspections include the safety attribute and element performance inspections.

We have sent identical letters to Chairman Obey, Senator Cochran, and Congressman Lewis.

Sincerely,

A handwritten signature in black ink that reads "J. R. Babbitt". The signature is written in a cursive style with a large, looping initial "J".

J. Randolph Babbitt

The Honorable Thad Cochran
Committee on Appropriations
United States Senate
Washington, DC 20510

Dear Senator Cochran:

As requested in the Explanatory Statement for the Omnibus Appropriations Act, 2009, the Federal Aviation Administration is pleased to provide the Safety Attribute and Element Performance Inspections Report.

The FAA was asked to provide semi-annual reports to the House and Senate Appropriations Committees that list all overdue safety attribute and element performance inspections and provide a target date of their completion. Safety attribute and element performance inspections are components of performance and design inspections. They are not isolated and do not have their own dates for completion. Therefore, we have provided additional information on comprehensive inspections. These comprehensive inspections include the safety attribute and element performance inspections.

We have sent identical letters to Chairmen Inouye and Obey and Congressman Lewis.

Sincerely,

A handwritten signature in black ink that reads "J. Randolph Babbitt". The signature is fluid and cursive, with a large loop at the beginning.

Overdue Safety Attribute Inspections and Element Performance Inspections

Requirement: Therefore, the Committee directs the FAA to provide quarterly reports to the House and Senate Committees on Appropriations that lists all overdue safety attribute inspections (SAIs) and element performance inspections (EPIs) and provides a target date of their completion.

Response: FAA principal inspectors conduct design assessments to determine whether or not an air carrier's operating systems comply with safety regulations and standards. They accomplish performance assessments to determine whether or not an air carrier follows its FAA-approved procedures and whether or not those procedures produce the intended results. SAIs and EPIs are a series of specific questions inspectors use to collect data for Air Transportation Oversight System (ATOS) design and performance assessments. ATOS is a resource management tool. It enables FAA managers to assign inspectors to activities with the highest priority (based on risk) before assigning them to activities with lower priority.

ATOS policy establishes how often inspectors conduct design and performance assessments (baseline frequency). Inspectors must conduct design assessments every five years. FAA considers a design assessment completed in the past five years as up-to-date. Design assessments performed more than five years ago exceed the baseline interval, and we have listed them in the attached report. Similar criteria apply to performance assessments. Inspectors must conduct performance assessments every six months, one year, or three years, depending on the criticality¹ of a failure in the program element assessed. Each calendar quarter principal inspectors rank all of the assessments due that quarter according to their relative safety risk.² Managers assign inspectors to assessments with the highest risk and work down the priority list. Since FAA does not have unlimited resources sometimes those assessments with the lowest safety risk are not accomplished. In fact, FAA uses ATOS to apply resources to areas of highest risk and consequently, low-risk design and performance assessments that exceed baseline frequencies are evidence of that. Managers and inspectors concentrate on doing high-quality inspections, rather than trying to do everything at the expense of quality. We intend to accomplish all design assessments as close as possible to the baseline, five-year interval. However, we do not intend to require frontline managers to complete all performance assessments within baseline intervals unless they have the resources to do so without sacrificing quality.

Occasionally, inspectors defer inspections for other reasons. For example if an air carrier is required to make changes to its flight crewmember training program due to observed deficiencies, there is no point in assessing the performance of the training program until the

¹ The criticality of an air carrier operating system (e.g., de-icing, fueling, flight crewmember training) is categorized as high, medium, or low based on the likelihood that a failure in the system will result in an unsafe condition.

² The relative risk of an assessment is determined by scoring twenty-eight risk indicators that represent potential hazards affecting the operating system to be assessed. Risk indicator scores are summed for each assessment and multiplied by a factor of 3 (high-criticality systems), 2 (medium-criticality systems), or 1 (low-criticality systems) thus establishing a risk-based priority for each assessment. Principal inspectors make further adjustments to priorities due to factors not covered by the risk indicators. For these reasons, assessment of a high-criticality system could be determined to be low risk.

changes are complete. Similarly, if an air carrier is making extensive changes to its maintenance procedures, a design assessment of the maintenance program would normally be deferred.

Design and performance assessments that exceed baseline frequencies are ranked based upon risk in subsequent calendar quarters with the additional assessments scheduled for that quarter. In some cases, assessments exceeding baseline frequencies will not move up the priority list until the next, similar assessment comes due. For example, the “Carry-On Baggage Program” is a medium-criticality assessment due every year. If, hypothetically, inspectors determine an airline’s carry-on baggage program has low risk (e.g., the airline follows its approved process appropriately as observed during en route inspections), assessment of this program may not have a higher risk assessment until it exceeds its baseline frequency for a full year. At that time it will “catch up” with the next projected assessment of the Carry-On Baggage program. When this situation occurs, the original assessment becomes redundant—i.e., there is no need to do the same assessment twice in the same interval—and inspectors will not accomplish it. FAA archives assessments in this category and designates them as inspections for which resources were not available. Also, the next assessment is assigned a higher risk score and, potentially, a higher priority.

We have listed in the attached report performance assessments more than six months old (high criticality), more than one year old (medium criticality), or more than three years old (low criticality). The report also includes the dates these assessments are next scheduled to be accomplished.

Safety attribute and element performance inspections are components of performance and design assessments. They are not isolated, and do not have their own dates for completion. Therefore, we have provided additional information on comprehensive assessments. These comprehensive assessments include the safety attribute and element performance inspections.

The attached report contains data current as of October 5, 2009. There were 9 overdue design assessments and 476 overdue performance assessments, representing 0.1 percent and 5.7 percent of the total, respectively. These design and performance assessments represent oversight activities with the lowest safety risk.

Overdue Design Assessments by Operator, Specialty, and Element
Data as of 10/5/09

Key to Column Headings:

- Operator Name - the name of the operator
- Specialty - the type of assessment (A=Airworthiness, O=Operations)
- Element - the ATOS element for which the design assessment was planned
- Element Name - the name of the ATOS element for which the design assessment was planned
- Overdue - the date the design assessment became overdue
- Next DA - the due date for the next planned design assessment for the element

US AIRWAYS INC	A	1.3.4	Required Inspection Items (RII)	H	7/31/09	9/30/2009 ⁵

¹Assessments completed within 30 days of the end of the quarter in which they are due are considered to have been completed by the due date. This policy allows data collection to continue until the end of the quarter and provides 30 days for principal inspectors to analyze the data and make a decision about the design or performance of the air carrier's program.

²Assessments deferred to accommodate on-going program changes due to the merger of Delta and Northwest airlines.

³Assessments will not be accomplished because these programs will not be used after Northwest and Delta Airlines are operating under a single certificate in the January 2010 time frame.

⁴Assessment deferred to FY09Q4 due to redesign of Southwest Airlines maintenance program.

⁵Assessment inadvertently moved from FY09Q2 to FY09Q4.
