Overview

Energy, Emissions & Noise Reduction Objectives

• FMS Efficiency improvements  
  - Dynamic Quiet Climb  Complete 
  - FMS Wind Input Optimization  Complete

• FMS/ATM Integration  
  - Trajectory Synchronization  Complete 
  - Trajectory Optimization Tasks  Ongoing

• FMS/Engine Integration  
  - Adaptive Engine Control  Ongoing 
  - Integrated Vehicle Health Management  Ongoing 
  - Integrated Flight-Propulsion Control  Ongoing
Schedule for GE Aviation Systems Led Efforts

Contract Year 1
- FMS/ATM Integration
- Trajectory Synchronization

Contract Year 2
- Design
- Software Development
- Quantification of Results
- Trajectory Optimization

Contract Year 3
- Design
- Software Development
- Quantification of Results

Contract Year 4
- Startup
- SW Development
- Concept Evaluations
- Reports

Contract Year 5
- Modeling
- Test/Demo
- Today

Trajectory Synchronization

**Phase 1A**
- **Core simulation** environment with integration and communication between aircraft and ERAM
- Incorporate **fast-time trajectory predictor** for primary aircraft
- **Single aircraft** position tracking throughout flight
- CPDLC / ADS-C EPP Implementation (Trajectory Downlink continuation)

**Phase 1B**
- **Expanded** CPDLC / ADS-C messages
- Incorporate **simulated FMS (sFMS)** for primary aircraft
- Incorporate **multiple aircraft** capability using FPPD
- Expanded interface to ERAM
- Real-world environmental benefits
- **Demonstrate** at Embry Riddle Aeronautical University Flight Test Bed

In collaboration with Lockheed Martin and Embry-Riddle Aeronautical University
Trajectory Synchronization Benefits

- Greatly improves aircraft predictability
- Allows accurate conflict detection far in advance of the conflicts occurring
- Early mitigations to these conflicts in cruise are less drastic and much more efficient

**Benefit Analysis Scenarios**

- **DEN→SEA:** Original flight vectored off plan for 44 seconds of delay, early conflict resolution measure added 44 seconds of delay via speed reduction
- **LAX→SEA:** Original flight put in hold pattern for 7 minutes 42 seconds of delay, early conflict resolution measure added 7 minutes 42 seconds of delay via speed reduction
- **MCI→SEA:** Original flight vectored at non-optimal altitudes and airspeeds for 18 minutes 51 seconds of delay, early conflict resolution measure added 18 minutes 51 seconds of delay via speed reduction (11:38) and path stretch (7:13)

**Benefit Analysis Results**

Trajectory Optimization

Using knowledge from ATC on flow management constraints, other traffic, and weather, decision support tools at AOC can recommend more efficient vertical and lateral routing and speeds to reduce fuel & emissions.
GE Aviation

FAA CLEEN
Fuel-Burn Reduction
(FMS-Engine Integration)
FMS-Engine Integration Technologies – 3 Primary Focus Areas:

- Integrated Flight-Propulsion Control - Synergistic optimization of engine and aircraft
- Adaptive Engine Control - FMS for computation and communication with aircraft and ground systems
- Integrated Vehicle Health Management (IVHM) - Uses knowledge of engine health

State-awareness is key aspect of FAA CLEEN technology development & maturation

Thirteen FMS-Engine technologies being evaluated

- Eight led by GE Aviation Engines
- Five led by GE Aviation Systems

Execution Plan

- Modeling - Create integrated models of aircraft, FMS, and engine (TRL 3)
- Concept Evaluations - Analyze each idea to assess feasibility (TRL 3)
- Software Development - Modify software (TRL 4-5)
- Test/Demo - Perform hardware-in-the-loop laboratory tests and demonstrate benefits (TRL 6)
FMS-Engine Integration Technologies – 3 Primary Focus Areas:

- Integrated Flight-Propulsion Control (IFPC) - Synergistic optimization of engine and aircraft
- Adaptive Engine Control – Uses knowledge of aircraft state and engine health to optimize performance
- Integrated Vehicle Health Management (IVHM) - Uses knowledge of engine health to optimize aircraft performance

State-awareness is key aspect of FAA CLEEN technology development & maturation

Information sharing

New control concepts and methods

Unified Model
- Guidance & Navigation
- Flight Controls
- Engine Controls

Progress

Engine modeling effort completed, on-engine testing is continuing. Integrated aircraft-engine-FMS model will be completed this year.

Control logic design tracking plan, first engineering release of FADEC with some of the concepts implemented will be next month.

Logic provided to airframers for desktop and iron bird testing, approved by airframers for implementation in product.

PFR and PDR for controls hardware completed.

Started hardware acquisition for concepts that require engine hardware modification for engine demo. of fuel burn reduction concepts.

Three of the technologies considered mature enough that they have bought their way onto specific engine programs.
