It's Free Insurance You Can Depend On!

ALASKA FLIGHT SERVICES

We help ensure safety of flight: At our 17 FAA-operated stations over 140 dedicated Air Traffic Control Specialists (ATCS) provide the information and services necessary to help you complete your flight safely. During the inflight portion of your flight we are often the only source for information pertinent to your flight.

Pilot Weather Briefings: Call us for the most current weather and aeronautical information. When conditions and flight rules warrant, our certified ATCS's will use their judgment to advise you on the best course of action to take. We can provide information on trends, weather cameras and how local weather may be affected by terrain and other factors.

Pilot Reports (PIREPs): Call us and share information in real time on the weather conditions you encounter in flight. We receive and disseminate over 30,000+ PIREPs annually! PIREPs also help keep area forecasts updated. Your fellow pilots will appreciate your contribution.

Notices to Airmen (NOTAMs): Alaska Flight Service disseminates aeronautical information, sometimes derived from pilot reported conditions on items such as recent runway snow accumulations or newly rutted runways. This current information is available to all pilots through Flight Service.

Inflight Services: We cover the state! Contact us via radio over one of our remote communication outlets (RCO) to make position reports and get weather updates. Avoid mid-air collisions -- participate in local airport advisory service and access the FSS Automated Flight Information System (AFIS) where available.

If you find yourself in an emergency or distress situation, do not hesitate to contact the nearest Flight Service Station for emergency service. Call early to stay safe!

Alaska Flight Service Stations still monitor 121.5 and provide emergency services. With the discontinuance of satellite monitoring of 121.5 ELTs Alaska Flight Service Stations remain a tight link in your chain of safety!

Flight Plans: We are your IFR and VFR portal to the National Airspace System. For VFR pilots, filing a flight plan guarantees that, should you become overdue, search and rescue procedures will be initiated automatically to locate you and your aircraft. Alaska is a big state, and every minute is crucial. So do yourself, your passengers and the folks who care for you a favor...

ALWAYS FILE A FLIGHT PLAN!

You may now add your automated GPS flight tracker information to your flight plan, including your master flight plan.

We are looking to the future: We are working to develop technologies and strategies to improve service.

- Enhanced Special Reporting Services (eSRS)
- New Remote Communications Outlets (RCO)
- Weather Cameras
- "Delta" weather briefings
- New Flight Service Station facilities

Dillingham Flight Service Station
Construction preparation underway
