DECLERATION LEG LENGTH FAILURE

FLAAG to STARZ SEGEMNT

The requirements stated in Order 8260.3F, (United States Standard for Terminal Instrument Procedures (TERPS)), paragraph 2-2-10.a. are:
"2-2-10. Deceleration. Sufficient distance and a reduced descent gradient are required prior to any fix with a speed restriction. STARs not meeting the requirements of this paragraph may be authorized with Flight Standards approval (see paragraph 1-4-2).

a. Where deceleration is required but descent is not permitted (for example, between two fixes with the same mandatory altitudes) or is not required (for example, between two fixes with the same minimum altitudes), provide a minimum distance of at least 4 NM prior to a fix with a speed reduction of 40 KIAS or less. For deceleration greater than 40 KIAS, allow 1 NM between fixes for every 10 knots of deceleration required. For example, a deceleration of 10, 20, 30, or 40 KIAS requires a minimum length of 4 NM; a deceleration of 50 KIAS requires a minimum length of 5 NM; a deceleration of 60 KIAS requires 6 NM.

Paragraph 1-4-2. …states in part:
"**Nonstandard IFP.** …obstacles, navigation information, or traffic congestion may require special consideration where justified by operational requirements. In such cases, nonstandard IFPs that deviate from these criteria may be approved, provided they are documented, and an equivalent level of safety exists…"

RSO179: [Approval Required] The length of the leg from FLAAG to STARZ is 7.76NM. This leg must be at least 12.0 NM long due to deceleration from 250.0 KIAS to 210 KIAS between 6000.0 ft. MSL to 4000.0 ft. MSL. Flight Standards approval is required.

The segment with the restrictions of at 11000 at ROKTT 250KIAS followed by cross STARZ between 4000/5000 and 210KIAS requires a 12 NM length, per the 8260.3F paragraph 2-2-10 a, for a reduction of 10- 40Kts. The deceleration required by the ROKTT-STARZ segment is 40 Kts. The reduction from 250 Kts to 210 Kts from ROKTT to STARZ is 5.86 NM. The previous fix ANTHM has no restrictions therefore the aircraft will be at or below 250 KIAS 17.65 NM prior to reaching STARZ. The distance from ANTHM to STARZ is 30.66 NM allowing ample distance to reduce speed to 210 KIAS. The KBWI ANTHM STAR has been in publication for several years and there have been no instances where aircraft could not make this restriction reported.

Consideration was given to removing and or changing the restrictions at ROKTT and or STARZ. However, to allow aircraft to be configured for the segments following STARZ restrictions remained unchanged since there has never been a reported difficulty and was not an impediment to the safety or profile of the procedure.

Descent Gradient

LUNDY to CURBY Segment

The requirements stated in Order 8260.3F, (United States Standard for Terminal Instrument Procedures (TERPS), paragraph 2-2-8.a. are:

"(1) the maximum permissible gradient 10000 MSL and above is 330 ft/NM (approximately 3.11 degrees).

"(2) The maximum permissible DG below 10000 feet MSL is 318 ft. /NM (approximately 3.0 degrees).

"(3) When a STAR contains a descent between fixes that passes through 10000 feet MSL, themaximum permissible DG is between 318 ft. /NM and 330 ft. /NM and is in proportion to theamount of the altitude change that is below/above 10000 feet MSL. Use formula 2-2-1 to determine the maximum DG (DGmax) between fixes that contain a descent that passes through 10000 feet MSL."

Paragraph 2-2-8.b states:
"When a gradient exceeds the maximum DG allowed in paragraph 2-2-8a, the STAR requires approval."

Paragraph 1-4-2. …states in part:
"Nonstandard IFP. …obstacles, navigation information, or traffic congestion may require special consideration where justified by operational requirements. In such cases, nonstandard IFPs that deviate from these criteria may be approved, provided they are documented, and an equivalent level of safety exists…"

RSO144: [Approval Required] The Descent Gradient (343.21) from LUNDY to CURBY is greater than the Maximum Permissible Descent Gradient (330.0).

A computed descent gradient value from LUNDY to CURBY of 343.21 ft./NM resulted from the descent gradient being calculated from descending from the restriction of At FL290 at LUNDY (FL290 used) to cross CURBY AOB FL240 and At or ABOVE FL210 (FL240 B FL210) over 46.09 NM. The restriction after CURBY is at BUBBI, a restriction of AOB FL180 and AOA 15000 (FL180N15000). The restriction after BIBBI is AOB 15000 at SHEPH then AOB13000 and AOA12000 (13000B12000) at EAGLL and 11000 at JABRR then AOB 9000 at OLBAY. The distance required to descend from LUNDY at FL290 to OLBAY at 9000 is 111.26 NM. Calculating a descent gradient from LUNDY to OLBAY 111.26 NM resulted in a descent gradient of 329.4 ft./NM.

Consideration was given to removing and or changing the restrictions at LUNDY, CURBY, SHEPH, EAGLL, JABRR and OLBAY. However, due to airspace constraints and traffic flows it was decided that the restrictions are necessary to prevent aircraft from entering adjacent airspace, prevent conflictions from other traffic and procedures, and reduce ATC workload due to required coordination, (point outs).

RSO144: [Approval Required] The Descent Gradient (363.99) from OLBAY to CRABZ is greater than the Maximum Permissible Descent Gradient (318.0)

A computed descent gradient value from OLBAY to CRABZ of 363.99 ft./NM resulted from the descent gradient being calculated from descending from the restriction of AOB 9000 at OLBAY to cross CRABZ AOB 6000 and AOA 5000 (6000 B 5000) over 10.99 NM. The restriction after CRABZ is at FINNZ, a restriction of AT 5000. The distance required to descend from OLBAY at 9000 to FINNZ at 5000 is 16.68 NM. Calculating a descent gradient from OLBAY to FINNZ resulted in a descent gradient of 239.80 ft./NM.
