Charting Dmax (Service Volume)

Adding:

DRAFT Order 8260.19H, paragraph 4-6-10j:

f. GLS ground stations have varying service volumes based on installation and siting. GLS service volume is referred to as “Dmax.” Dmax is measured from the centroid of the ground GPS reference receiver antennas. Dmax is reported on the “Airport Details” Airport Datasheet. For GLS procedures, calculate where Dmax would occur on the procedure and include a waypoint (either existing or created to support this), which is at least 1 nm inside actual Dmax and annotate with “(DMAX)” label above the waypoint. This waypoint could be either a CNF or an existing waypoint. This waypoint is only for situational awareness and will be included on Form 8260-3/-7A so that it can be included on the approach chart. For example, “From MAKKO to KABBY (DMAX)” on Form 8260-3/-7A in the Terminal Routes section.”
