

GPS/GNSS Jamming/Spoofing

Christina Clausnitzer
Office of Safety Standards

Apr 24, 2024

**Federal Aviation
Administration**

Why is civil GPS/GNSS vulnerable?

- **Signals are extremely weak and easily overpowered**
- **Public GPS/GNSS signals have no security protocols**
 - Unencrypted and unauthenticated digital data messages
- **Easily imitated (open public standards)**
- **Most devices “blindly” trust signals they receive**
- **Unlike computers/routers, GPS/GNSS has no firewall/virus protection**
- **Spoofing, tactics & techniques-widely available on the internet**
- **Low-cost devices have large area effect**

GPS/GNSS can be trusted, but how do you know what you're using is actually from GPS/GNSS?

Aircraft and ATC GPS/GNSS Dependencies

- **Comm:** Datacom, SATCOM, Networks
- **Nav:** RNAV, RNP & LPV
- **Surveillance:** ADS-B and ADS-C
- **Safety:** GPS/GNSS enables Terrain Awareness and Warning System (TAWS) forward-looking function
- **Automation & Aircraft Specific Functions**
- **Support Equipment:** Elec Flt Bag, etc.
- **FAA ATC & Industry Infrastructure**

*May not be able to identify erroneous GPS/GNSS signal
nor “deselect” the signal*

Federal Aviation
Administration

False Alerts & Warnings

Two fundamental principles:

1. Trust Your Instruments
2. Follow Standard Operating Procedures

Pilot must either:

1. Ignore alerts/warnings; or
2. Follow required checklists & execute mandatory evasive maneuvers

Representative Audio:

Spoofing can result in repeating TAWS alerts and other alerts

- Aural Warnings cannot be muted or turned down

Pilot workload and desensitization

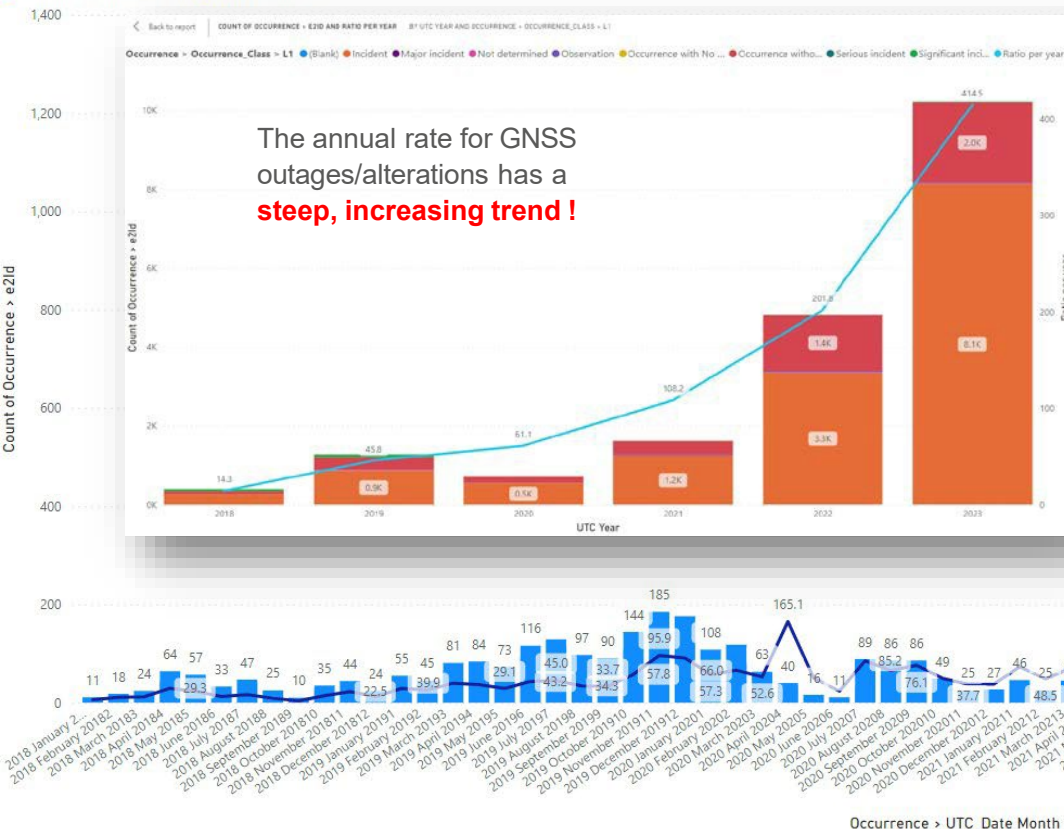

Federal Aviation
Administration

GNSS outage (ECR data)

< Back to report | COUNT OF OCCURRENCE > E2ID AND RATIO PER MONTH BY YEAR, MONTH AND YEARMONTH

● Count of Occurrence > e2id ● Ratio per month

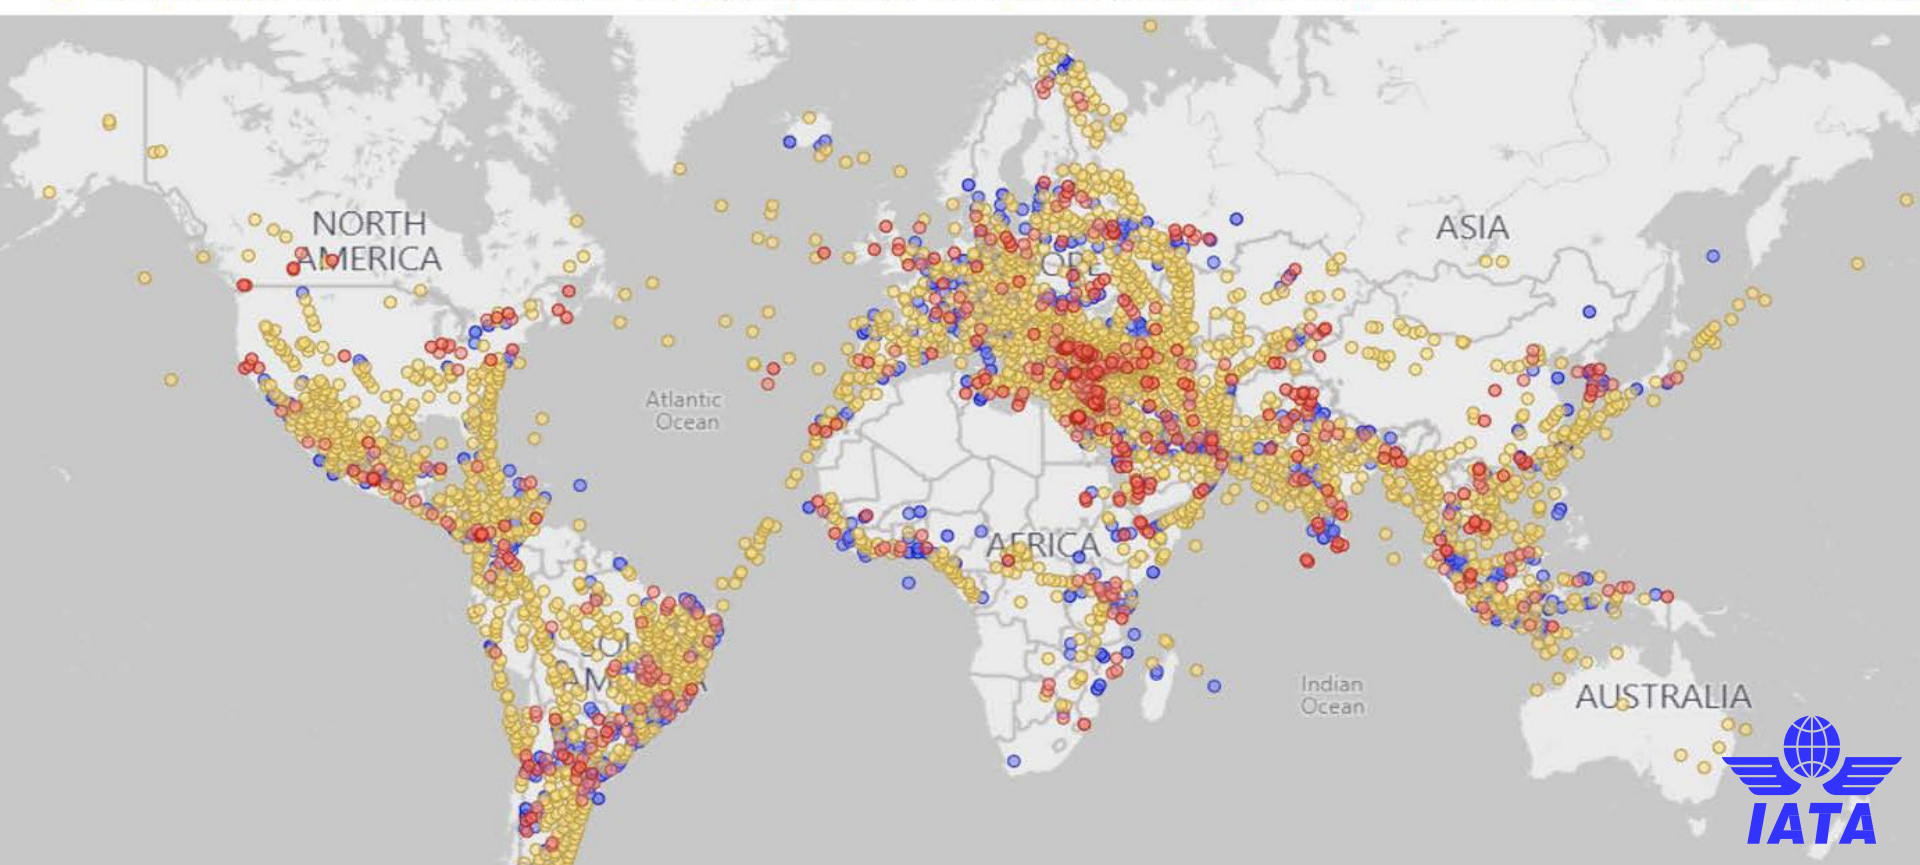

Continued increase in GNSS jamming and cases of spoofing resulted in EASA SIB 2022-02R2 being issued in November 2023

Federal Aviation
Administration

GNSS Signal Loss Occurrence by Phase of Flight

● <15 mins after TO ● 15-30 mins after TO ● 30+ mins after TO and before LDG ● 30-15 mins before LDG ● <15 mins before LDG

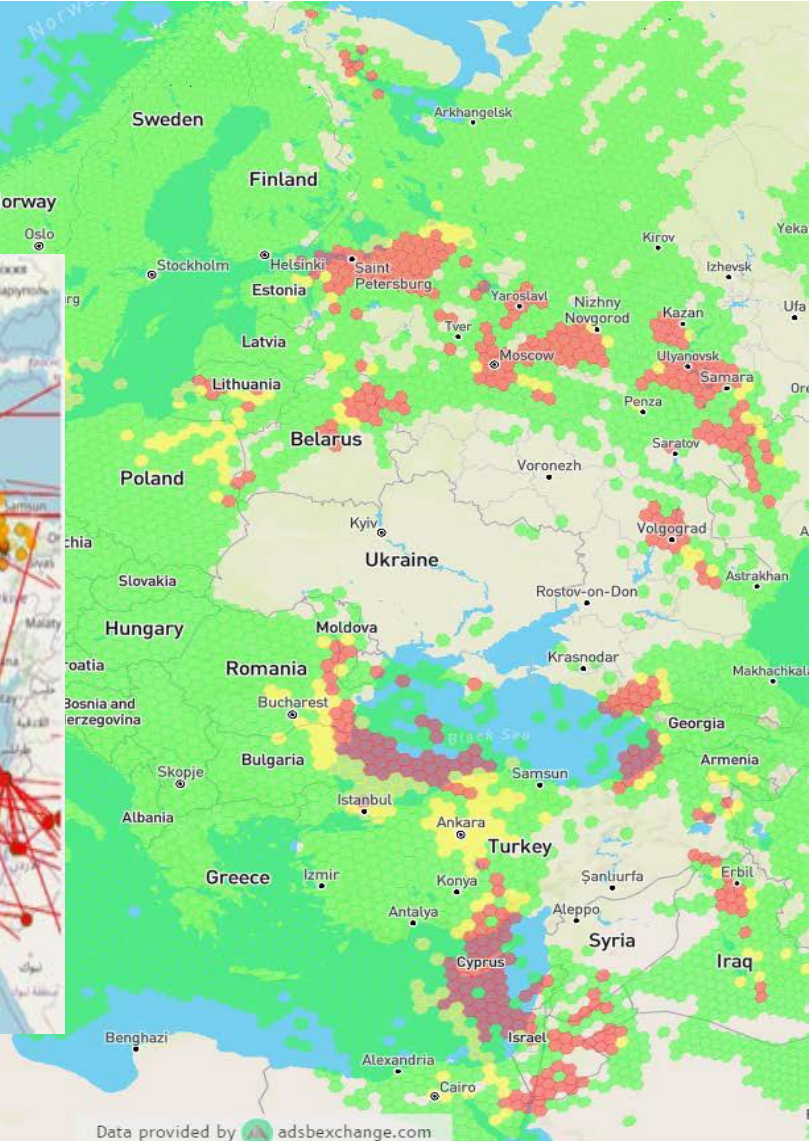

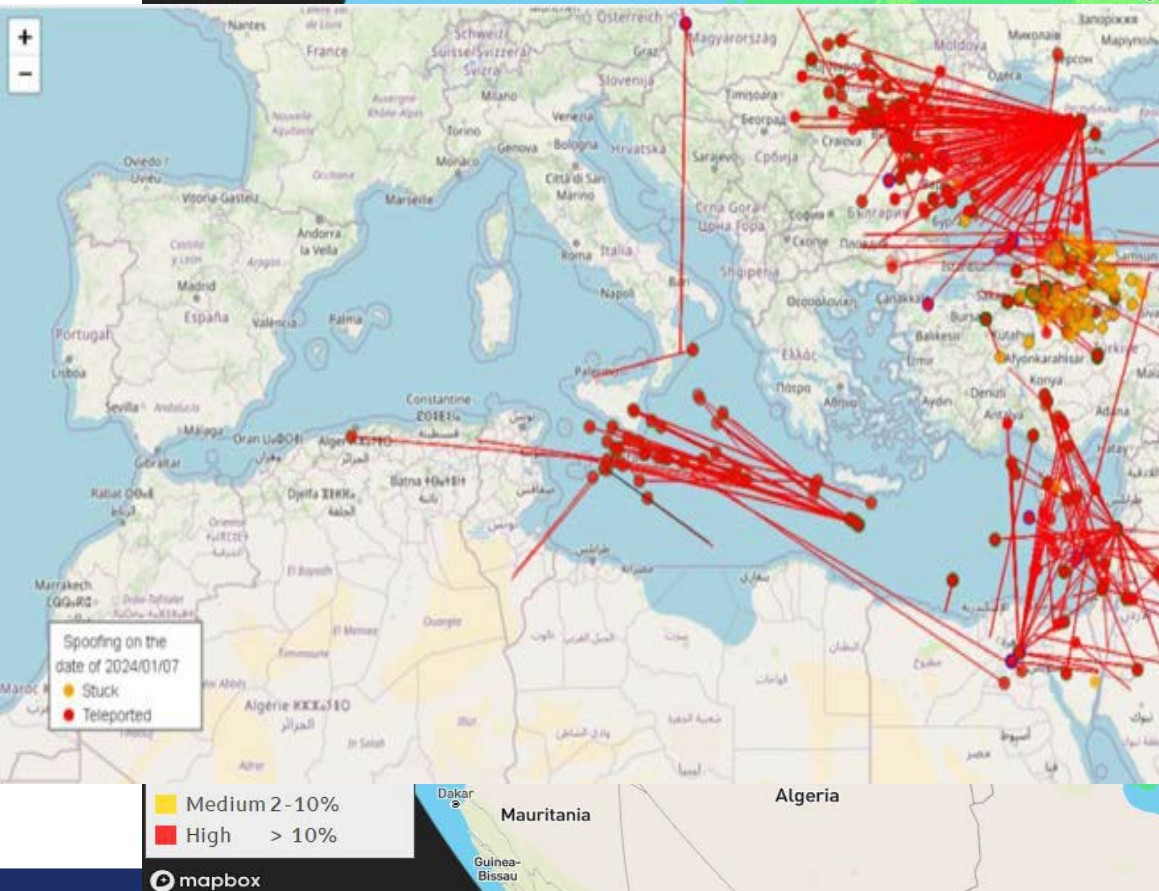

Jun 2022-Jun 2023: 209 Airlines recorded ~150,000 Loss of GPS Events in ~5 million flight operations

Spoofing and jamming (EUR/MID)

Federal Aviation
Administration

FAA Jamming / Spoofing Activities

- SAFO (25 Jan 24) provides information and guidance to operators and manufacturers for operations in a disrupted environment
- Performance Based Navigation (PBN) Aviation Rulemaking Committee (PARC) GPS Disruption Action Team coordinating with stakeholders to ensure safe and efficient continuity and recovery of aircraft
- Leveraging industry and international partners and RTCA to identify and implement both operational & technical mitigations
- Developing integrated FAA/Industry “Playbooks” for future events
- FAA working with RTCA to improve DME PBN Navigation capability
- Evaluating situational awareness tools for display and decision making
- FAA researching jam and spoof resistant antennas for civil aircraft

Takeaways

- **Enriching NOTAM language when GPS disruptions occur**
 - Possible update to Order 7930.2T
 - NOTAMS publish as soon as jamming/spoofing has been corroborated (e.g., airport-specific or area/ region wide impacts)
- **Reviewing GPS resiliency programs with a 2024 lens**
- **Reviewing routes/procedures for "GPS required" as necessary**
