Small Airplane Issues List (SAIL)

This issues list is applicable to both international validation and domestic certification projects for which the Small Airplane Standards Branch oversees new and revised policy. At this time, this list is incomplete and represents only a portion of the issues that require additional policy besides the policy already available on the FAA’s Regulatory and Guidance Library. This issues list (the SAIL) will continually be updated with those issues as we develop more standardized policy. Not all of these issues have template issue papers or policy memos available to ease the perceived burden of industry compliance to such policy, but we are working toward that end. The Small Airplane Standards Branch relies on the submittal of the Certification Project Notification by the geographic aircraft certification office (ACO) for domestic certification projects to evaluate the need for additional policy and we communicate that need to the (ACO) through the CPN response.

Note- The below listed published FAA Advisory Circulars, Policy, and guidance are located on RGL at the following link:  https://rgl.faa.gov/

Common terms on this list:
SASB – Small Airplane Standards Branch
MOC – Means of Compliance

1080 V1.0 Special Class Products

Airships, Gliders (Sailplanes), and Very Light Airplanes are certificated by the FAA under 14 CFR 21.17(b) as "special class" products. These special class products use airworthiness design criteria as their certification basis rather than the airworthiness standards under Title 14, Code of Federal Regulations (14 CFR), part 23 etc.

The FAA has published accepted means of compliance (MOC) that establish the airworthiness criteria for Gliders (Sailplanes), Very Light Airplanes, and Airships. The FAA published Advisory Circulars (AC) are:

AC 21.17-2A, Type Certification—Fixed Wing Gliders (Sailplanes) establishes European Aviation Safety Agency (EASA) CS-22 and Joint Airworthiness Requirements (JAR-22) sailplane regulations as acceptable airworthiness criteria,

AC 21.17-3, Type Certification of Very Light Airplanes under FAR 21.17(b), establishes EASA CS-Very Light Airplanes (CS-VLA) and JAR-VLA regulations as acceptable airworthiness criteria,

AC 21.17-1A, Type Certification—Airships, and FAA-P-8110-2, Airship Design Criteria and additional policy memos.

The FAA must provide a public notice and respond to public comments when changes to airworthiness criteria are proposed or when newly established airworthiness criteria are proposed to be applied to a new product.

Any new products proposed to be certificated under 14 CFR 21.17 (b) special class and any changes to existing special class products that modify the established airworthiness criteria or deviate from the FAA accepted MOC will require Small Airplane Standards Branch involvement.
V1.0 Amendment 23-62 Errors

If an applicant is using part 23, amendment 23-62, for new products or product changes including STCs, then the SASB must determine whether an equivalent level of safety (ELOS) finding is necessary due to 14 CFR part 23, amendment 23-62 containing various errors.

The FAA develops/issues ELOS findings per 14 CFR 21.21(b). However, the FAA will likely delegate the compliance finding to the Foreign Civil Aviation Authority for the part 23, amendment 23-62, errors ELOS finding memorandum. A copy of these errors and their corrections is available upon request.

Applicants using part 23 amendment 23-62 as the Means of Compliance (MOC) to amendment 23-64 must also address these errors.

ACOs and applicants should review the Project Specific Policy Memo for the most accurate list of regulations with errors.

As of 3/13/18, the known errors exist in the following regulations:

- 23.45, amendment 23-62 General (Performance)
- 23.51, amendment 23-62 Takeoff speeds
- 23.63, amendment 23-62 Climb:General
- 23.67, amendment 23-62 Climb:One engine inoperative
- 23.73, amendment 23-62 Reference landing approach speed
- 23.77, amendment 23-62 Balked landing
- 23.161, amendment 23-50 Trim
- 23.181, amendment 23-62 Dynamic Stability
- 23.221, amendment 23-50 Spinning
- 23.251, amendment 23-62 Vibration and buffeting
- 23.253, amendment 23-62 High speed characteristics
- 23.571, amendment 23-62 Metallic pressurized cabin structures
- 23.785, amendment 23-49 Seats, berths, litters, safety belts, and shoulder harnesses
- 23.831, amendment 23-62 Ventilation
- 23.1195, amendment 23-62 Fire extinguishing systems
- 23.1197, amendment 23-62 Fire extinguishing agents
- 23.1199, amendment 23-62 Fire extinguishing characteristics
- 23.1201, amendment 23-62 Fire extinguishing materials
- 23.1445, amendment 23-62 Oxygen distribution system
- 23.1527, amendment 23-45 Maximum Operating Altitude
- 23.1545, amendment 23-62 Airspeed indicator
- 23.1583, amendment 23-62 Operating limitations

V1.0 Application of 23.1309/23.2510 to Oxygen Systems on Unpressurized Airplanes With a Single Pilot

If the applicant is installing a conventional oxygen system in unpressurized airplanes, then the FAA may be involved to ensure a consistent and standardized approach to the applicability of 14 CFR 23.1309 at amendment 23-41 through 23-62/14 CFR 23.2510 at amendment 23-64 and after for conventional airplanes that operate up to 25,000 feet with a single pilot.
Prior to amendment 23-41 oxygen systems were not evaluated as part of the system safety process for 23.1309. On some recent projects that installed conventional oxygen systems in unpressurized airplanes 23.1309/23.2510 were applied inconsistently because different assumptions were made about the severity of oxygen failure conditions and different approaches were used for the applicability of 23.1309/23.2510.

Oxygen system failure during unpressurized flight at 25,000 feet could be potentially catastrophic, but could also be less severe, depending on the pilot's ability to recognize the failure and respond before becoming excessively impaired by hypoxia. 23.1309/23.2510 are not applied when specific requirements adequately address failure or abnormal operation, and determining the applicability is not always clear.

An issue paper has been developed to improve standardization for classifying oxygen failure conditions and for standardizing the applicability of 23.1309/23.2510 for conventional oxygen equipment on unpressurized airplanes that operate up to 25,000 ft with a single pilot.

14 CFR 23.2510 at amendment 23-64 and after

1260 V1.0 Required Navigation Performance Authorization Required (RNP AR) Coordination

FAA headquarters retains oversight of all applications for operations approval to conduct Required Navigation Performance Authorization Required (RNP AR) operations. To avoid delays in processing these operations applications and confirming aircraft qualification, Aircraft Certification field offices should coordinate all RNP AR aircraft qualification airworthiness applications with the Navigation and Flight Technologies section (AIR-6B1) at FAA headquarters. Coordinating the application with AIR-6B1 will ensure the aircraft qualification requirements are met and documented in a manner facilitating an applicant's expeditious RNP AR operations approval.

14 CFR 23.2510 at amendment 23-64 and after.

1360 V1.0 Additive Manufacturing

If the applicant is proposing to use Additive Manufacturing (AM), then they must coordinate their proposals with the SASB to determine the level of involvement the FAA requires with respect to policy or guidance.

AM is a relatively new manufacturing process and describes the process of joining materials to make objects from three dimensional (3D) model data using layer upon layer technique/method, as opposed to subtractive manufacturing methodologies. This manufacturing technique is sometimes referred to as 3D printing. AM is a generic term that spans a diverse range of techniques using a wide range of machines and technologies, such as Laser Powder Bed Fusion (LPBF), Electron Beam Powder Bed Fusion (EBPBF), and Directed Energy Deposition (DED) just to name a few. Some of these sub-categories of AM may even employ technologies that differ and have their own unique considerations for certification.

The FAA is actively working on draft policy and guidance for the use of this new and novel technology.

Regulatory Reference: No rule at 14 CFR 23 at amendment 23-63 and prior.
14 CFR 23.2010 at amendment 23-64 and after.
Applicants must coordinate with the SASB if they are:

- Seeking FIKI approvals, or
- Proposing changes that affect or could affect existing FIKI approvals, or
- Proposing to modify an aircraft that has icing related airworthiness directives (AD), or
- Proposing to make autopilot modifications on an airplane certificated for icing prior to Amendment 23-43 to ensure the airplane has adequate low airspeed awareness.

If the applicant is including the use of Type II, III, or IV deicing/anti-icing fluids as part of their type design, then they must assess the impact of these fluids before operational use of such fluids is authorized.

Policy Statement, PS-ACE-23-05, provides an FAA accepted means of compliance (MOC) for using Type II, III, or IV deicing/anti-icing fluids.

14 CFR 23.2010, 23.2135, 23.2160, 23.2620 at amendment 23-64 and after.

If the applicant is using Electronic Engine Control (EEC) logic to determine if the airplane is operating in ice crystal conditions, then the SASB will be involved in the project. For example, blockage of the Tt0 probe by ice crystals has resulted in engine thrust rollbacks in ice crystal environments.

If the applicant is proposing to install electric or hybrid-electric propulsion systems, then they may require equivalent level of safety (ELOS) findings, special conditions (SC), or additional design criteria to address features not envisioned.

The need for SC, ELOS, design criteria and corresponding means of compliance (MOC) must be determined on a case-by-case basis for each installation. Specific policy does not exist at this time. Projects with electric propulsion or hybrid electric will require SASB involvement.

If the applicant proposes to use materials not previously accepted as fire proof, such as composite materials, then they may need to obtain an FAA accepted means of compliance (MOC) to 14 CFR 23.865 at amendment 23-63 and prior.

Testing is usually required to validate the performance of these materials.

At amendment 23-64 and after, the applicant should incorporate FAA accepted means of compliance (MOC) into their certification planning.

If the applicant proposes a firewall constructed with composite materials, then they must obtain and incorporate FAA accepted means of compliance (MOC) to 14 CFR 23.601, 23.603, 23.605, 23.859, 23.863, 23.903, 23.1013, 23.1091, 23.1121, 23.1123, 23.1141, 23.1182, 23.1183, 23.1189, 23.1191, 23.1192, and 23.1193 at amendment 23-63 and prior to ensure their proposed test and evaluation will be adequate.

While FAA Advisory Circular AC20-135 is an FAA accepted MOC that contains general guidance about the use of composite firewall materials, specific guidance is necessary to ensure a compliant design. Firewalls constructed with composite materials require consideration of unique fire threats, safety concerns and acceptance criteria that differs from those used to address firewalls constructed from traditional metallic materials.

 Applicants seeking to ensure that proposed test and evaluation will be adequate to show compliance with fire protection requirements for any firewall constructed with composite material should contact the SASB for additional guidance.

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning.

If the applicant is proposing installation of a diesel engine, then they may require special conditions or may require an Equivalent Level of Safety (ELOS) finding. All part 23 diesel engine installations must be evaluated per FAA Policy PS-ACE100-2002-004, Diesel Engine Installation. This policy statement identifies areas of regulatory compliance. The need for any specific ELOS findings or SCs must be determined on a case-by-case basis for each installation.

Installations being certificated to amendment 23-64 and after must include the evaluations contained in FAA Policy PS-ACE100-2002-004.

At amendment 23-64 and after, applicants should incorporate the requirements of the special condition into their certification planning as FAA accepted means of compliance (MOC) in lieu of a special condition or incorporate FAA accepted means of compliance (MOC) into their certification planning.
If the applicant is seeking to install an autothrust (autothrottle) system, then they may be required to apply special conditions to establish adequate requirements at amendment 23-63 or earlier based on the requirements of 14 CFR 25.1329.

At amendment 23-64 and after, applicants should coordinate with the SASB and incorporate the requirements of the special conditions into their certification planning for 14 CFR 23.2500, 23.2505, 23.2510, 23.2605 as FAA accepted means of compliance (MOC) in lieu of a special condition.

Regulatory Reference: No rule at 14 CFR part 23 amendment 23-63 and prior.

Reference 23.143 (amendment 23-50), and 23.1309 (amendment 23-62), and 14 CFR 25.1329 (amendment 25-119) via special condition at amendment 23-63 and prior.

If the applicant is seeking to install a full authority or supervisory engine control system (EEC/FADEC), then they may be required to apply special conditions to establish adequate requirements at amendment 23-63 or earlier.

At amendment 23-64 and after, applicants should incorporate the requirements of the special condition into their certification planning as FAA accepted means of compliance (MOC) in lieu of a special condition.

Regulatory Reference: No rule at 14 CFR part 23 amendment 23-63 and prior.

14 CFR 23.2010, 23.2400(c) and 23.2440(d) at amendment 23-64 and after.

If the applicant is seeking to install a turbine-engine-oil system and all parts of the system are not shown to be fireproof when a shutoff valve is not incorporated into the system, then they may need to obtain an FAA accepted means of compliance (MOC) to 14 CFR 23.1013(e) and 23.1189(b) at amendment 23-62 and prior.

Demonstration of compliance to the requirements of 14 CFR 23.1013(e) and 23.1189(b) has proven problematic in the past.

At all amendment levels, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning.

Regulatory Reference: 14 CFR 23.1013(e) and 23.1189(b) at amendment 23-63 and prior.
14 CFR 23.2010, 23.2400(c) and 23.2440(d) at amendment 23-64 and after.
1960  V1.1  Turbine Engines Shutdown

If the applicants turbine engine control system only includes a single means to shutdown the engine, then the applicant may require an FAA accepted means of compliance (MOC) to 14 CFR 23.1141(e) at amendment 23-63 and prior.

The installation requirements of § 23.1141(e) require that no single failure of a turbine-engine control system causes failure of any powerplant function necessary for safety.

Most engine control systems provide a redundant means for engine shutdown. For example, if the installed engine control system only provides a single means for shutting off fuel to the engine, then redundant means for engine shutdown must be provided to ensure a simple, quick, and safe shutdown if the primary means of shutdown fails.

At amendment 23-64 and after, applicants should coordinate 23.2410(a) with the SASB to incorporate an FAA accepted MOC into their certification planning.

Regulatory Reference: 14 CFR 23.1141(e) at amendment 23-63 and prior.
14 CFR 23.2010 and 23.2410(a) at amendment 23-64 and after.

1980  V1.0  Fuel- Approval of New Fuel

If the applicant is seeking approval to use a new fuel type, then they must coordinate their proposal with the SASB (and AIR 20 Alternative Fuels Program Office) to determine the level of FAA involvement with respect to policy or guidance.

There is considerable activity across the aviation industry; therefore, energy behind the introduction of new aviation fuels is high. These efforts are highly visible and potentially controversial.

NOTE: This is intended for fuels new to aviation where there is no existing FAA accepted standard for that fuel, not the approval of an existing aviation fuel for use on a specific model.

Regulatory Reference: 14 CFR 21.17(b)
14 CFR 23 at any amendment.

2000  V1.1  Powerplant Indications - Use of Digital Only Indications

If the applicant is seeking to install digital only display(s) in lieu of analog displays for powerplant instruments when complying with 14 CFR 23.1305 (where the term “indicator” is included in the regulation) and § 23.1549, since digital only indicators do not provide for arc, line, or radial markings, then they may require an Equivalent Level of Safety (ELOS) finding for §23.1301, 23.1305, 23.1311, 23.1321 and 23.1549 at amendment 23-63 or earlier.

At amendment 23-64 and after, applicants should coordinate 23.2500, 23.2505, 23.2606, 23.2615, 23.2610 with the SASB to incorporate FAA accepted means of compliance (MOC) into their certification planning in lieu of an ELOS finding.

2040  V1.0  Engine Cooling - Climb Speeds

If the applicant is proposing compliance with 14 CFR 23.1047, amendment 23-51, "Cooling test procedures for reciprocating engine powered airplanes", using an airspeed greater than the best
rate of climb speed (Vy) or balked landing climb (VREF) speeds, then they may need to obtain an FAA accepted means of compliance (MOC).

Section 23.63(a)(2), amendment 23-62, requires §§ 23.65 Climb: All engines operating; and 23.77, Balked landing, to use speeds not less than the speed used to demonstrate compliance with the powerplant cooling requirements (§§ 23.1041, amendment 23-51, through 23.1047). Applicants proposing to use an airspeed greater than those used to show compliance to §§ 23.65 or 23.77 to demonstrate compliance with § 23.1047 should propose a method of compliance that will ensure adequate engine cooling during all expected operating conditions.

Applicants should coordinate with the SASB to determine an appropriate MOC and incorporate the FAA accepted MOC into their certification planning.

14 CFR 23.2010, 23.2400(c), (e) at amendment 23-64 and after.

2080 V1.1 Engine Cooling - Coolant Tank Capacity Requirements

If the applicant is seeking to install liquid cooled reciprocating engines, then an Equivalent Level of Safety (ELOS) finding to 14 CFR 23.1061(b) may be required at any amendment up to and including amendment 23-63.

Some 14 CFR part 33 approved reciprocating engines include a self-contained cooling system that may not meet the installation coolant tank capacity and expansion space requirements of 14 CFR 23.1061(b).

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning in lieu of an ELOS finding.

Regulatory Reference: 14 CFR 23.1061(b) at amendment 23-63 and prior.
14 CFR 23.2010, 23.2400(c) at amendment 23-64 and after.

2120 V1.1 Fuel System - Pressure Defueling

If the applicant is seeking to install a pressure defueling system in accordance with 14 CFR 25.979(e), then they may require special conditions at amendment 23-63 and earlier to establish adequate requirements.

At amendment 23-64 and after, applicants should coordinate 23.2400(c) and 23.2430(c) with the SASB to incorporate the requirements of the special condition into their certification planning as FAA accepted means of compliance (MOC) in lieu of a special condition.

Regulatory Reference: No rule at amendment 23-63 and prior.
14 CFR 23.2010 at amendment 23-64 and after.

2140 V1.1 Fuel System - Temperature

If the applicant is seeking to establish the minimum level of safety expected for the effect of elevated fuel system temperatures on the airplane, then they may require special conditions at amendment 23-63 and earlier.

Fuel systems configured to reject engine heat through the airplane fuel tanks by use of an engine oil/fuel heat exchanger or other means may result in fuel tank temperatures above the critical temperature test requirements of 14 CFR 23.961 and 23.965(d).

At amendment 23-64 and after, applicants should coordinate 23.2430(a)(3) and (b)(1) with the
SASB to incorporate the requirements of the special condition into their certification planning as FAA accepted means of compliance (MOC) in lieu of a special condition.

Regulatory Reference: 14 CFR 23.961 and 23.965(d) at amendment 23-63 and prior.
14 CFR 23.2010 and 23.2430(a)(3) and (b)(1) at amendment 23-64 and after

2240 V1.1 Fatigue Management Programs

If the applicant is proposing to incorporate a Fatigue Management Program (FMP) into an existing product, then the FAA may need to be consulted to determine the certification basis and the accepted means of compliance (MOC).

FMPs cannot be mandated on existing products in the U.S. except through an Airworthiness Directive.

FAA Advisory Circular AC 91-82 is considered an accepted MOC.

There are varying approaches to the application of fatigue requirements to derivative model airplanes when the original model did not have fatigue requirements at initial certification. The SASB may be involved with these projects.

In addition, the FAA does not typically allow use of an inspection program in lieu of the safe life design limits already established. Reference AC 21.101-1B, Appendix Table A-2, Example 23, "Conversion from a safe-life design to a damage tolerance-based design".

Regulatory Reference: 14 CFR 23 at any amendment.

2250 V1.1 Load Relief/Alleviation Systems

If the applicant proposes to use load relief or load alleviation systems for aircraft structure, then they may require a special condition at amendment 23-63 or earlier to address the effect of such systems on aircraft structure. In addition, current regulations do not take into account the effects of system failures on aircraft loads.

At amendment 23-64 and after, applicants should coordinate with the SASB to incorporate the requirements of the special conditions into their certification planning as FAA accepted means of compliance (MOC) in lieu of a special condition.

Regulatory Reference: No rule at amendment 23-63 and prior.
14 CFR 23.2010 at amendment 23-34 and after.

2260 V1.1 Vinyl Covering Shrink Wraps on Exterior of Part 23 Airplanes, Gliders, and Airships

Applicants should be aware that the FAA has issued a memo stating there are safety issues with the installation of vinyl covering shrink wraps on the exterior of airplanes, gliders, and airships that are not present with other exteriors such as paint and deicing boots. These issues include hazards that are major to catastrophic, so the installation by FAA Field Approval is not acceptable. Only Federal Aviation Administration (FAA) Type Certificate (TC), Amended Type Certificate (ATC), and Supplemental Type Certificate (STC) are acceptable for this installation. This memorandum is not applicable to vinyl decals or logos that are placed on limited areas of the fuselage or empennage.

The following are safety concerns with the installation of vinyl shrink wrap coverings that must be evaluated by the applicant for any TC/ ATC/STC application:

1. Without proper engineering evaluation and/or tests, vinyl shrink wrap cannot be placed on any control surface or control surface tab:
a. without consideration of the effect on the flutter characteristics (whether the surface is mass balanced or not) and

b. where that installation would change the existing clearance between adjacent surfaces with and without loading.

2. Scoring the skin of aircraft when cutting the vinyl sheets to fit, which can start cracks, particularly in pressurized aircraft.

3. Blocking of fuel vents, static ports, hinges, drain holes etc., making them inoperative or changing the airflow over static ports.

4. Use of an open flame from a blowtorch to apply the material. This is a concern around fuel tanks and vents, sensitive antennas, and especially on composite parts, which have cure temperatures well below the temperature of a blowtorch.

5. Covering required exterior aircraft markings and emergency exits.

6. Vinyl sheets losing adhesion on the surface or on rotating parts and jamming control surfaces or compromising engines.

7. Static build-up causing electrical discharges in or around fuel tanks and causing radio/navigation interference.

8. Tinting of windows and windshields with transparent vinyl, which compromises the view of pilots.

9. The impact on removal of ice build-up on critical surfaces.

10. Flammability of the material, including lightning strikes, and especially near engine exhausts and around engine nacelles. Flammability test specimens should be built-up from the cowling/nacelle with the vinyl shrink wrap applied.

11. Peeling of the wrap from rain or hail.

12. Masking of cracks and corrosion in structure and skin.

14. Effects of de-ice fluids on the film.

The policy memo is available upon request.

FAA Airship Design Criteria.

EASA JAR 22/CS 22.
then they may require an Equivalent Level of Safety (ELOS) Finding.

The FAA has allowed exemptions or ELOS where a seatback could be pushed out of the path without any additional actions, while other foreign airworthiness certification authorities have permitted additional actions on seatbacks and climbing over seats with lowered seatbacks based on an evacuation test.

Applicants complying with 14 CFR part 23.807(b) at amendment 23-63 and prior must maintain an unobstructed path to emergency exits.

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning in lieu of an ELOS finding.

2300 V1.2 Composite Floats

If an applicant is seeking installation approval for composite floats that have not been approved to TSO C-27a, then they may need to obtain an FAA accepted means of compliance to address fatigue and durability requirements unique to composites as detailed in AC 23-19A Sections 201 through 207.

The guidance in AC-23-19A closely approximates requirements per §23.573 for composite structure. The use of composites also requires compliance methods that may require additional work to satisfy §23.603, §23.609 and §23.613 that are typically more onerous than that required for a metallic float.

At amendment 23-64 and after, the applicant should coordinate an FAA accepted means of compliance with the SASB to incorporate elements of TSO-C27a, NAS 807 r2, and/or AC-23-19A.

2360 V1.0 Replacement of Vacuum Driven Attitude Indicators

If the applicant proposes to replace vacuum-driven attitude instruments with electronically-driven indicators in CAR 3 and Part 23 airplanes, then they must use FAA accepted means of compliance (MOC).

Policy Statement, PS-ACE-23-08-R1, is an FAA accepted MOC.

Electronically-driven attitude indicators include indicators that use electrical power in place of vacuum to (1) excite an internal gyro, or (2) replace the operation of the gyro with microelectronics. Electronically-driven attitude indicators may replace the existing attitude indicators in airplanes including those approved for IFR operations.

2400 V1.0 Non-TSO Electronic Flight Instrument Systems and Avionics

If the applicant is seeking to install non-TSO avionics, then they may need to verify the level of FAA
involvement in their project.

Many avionics manufacturers have developed lower cost integrated display systems specifically for the Experimental and Amateur-built airplane markets. Although these systems have many or all of the same functions, they generally do not follow the design assurance processes specified in the TSOs. The TSOs only specify a minimum performance, and they often outline the design assurance requirements as well as environmental standards in addition to general operating requirements.

TSO authorization indicates that the article manufacturer has provided a statement of compliance with the TSO requirements and the article is produced under an FAA approved quality system. For non-TSO equipment, the installer bears responsibility for supplier control of the type design and the production of the article.

The FAA has issued several project-by-project policies that support the integration of such EFIS into part 23 airplanes. The FAA will determine their involvement for any EFIS that has not been certificated before.

14 CFR 23.2010, 23.2500, 23.2505 at amendment 23-64 and after.

2420 V1.4 HIRF and Lightning

If the applicant is proposing alternate methods of compliance for HIRF/lightning test levels, then they may incorporate FAA accepted means of compliance (MOC) (PS-ACE-23-10). PS-ACE-23-10 describes acceptable compliance methods to 14 CFR 23.1306 and 23.1308 (§§ 23.2515 and 23.2520) for level A systems in Class I, II, and III airplanes (certification levels 1, 2, and 3) as determined from Advisory Circular (AC) 23.1309-1E.

PS-ACE-23-10, is an FAA accepted MOC that may be used in lieu of the MOC described in AC 20-136B, "Aircraft Electrical and Electronic System Lightning Protection", and AC 20-158A, "The Certification of Aircraft Electrical and Electronic Systems for Operation in the High-intensity Radiate Fields (HIRF) Environment", for level A systems. The intent of PS-ACE-23-10 is to define an alternate means of demonstrating compliance with level A systems for HIRF and the indirect effects of lightning requirements for small airplanes without the need to perform full airplane test.

At all amendment levels, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning and coordinate with the SASB when incorporating alternate FAA accepted MOC into their certification planning.

NOTE: ASTM standards F3236-17, section 4.1.3, and F3061-17/19a, sections 17.3.3 address major hazards. These have been removed from part 23, amendment 64, rule language. Applicants using amendment 64 are only required to address hazards down to the hazardous level.

2460 V1.3 System Level Verification

If the applicant is proposing alternative means of compliance (MOC) for system level verification in place of RTCA/DO-178B/C for level 1 and 2 (class I and II) part 23 airplanes, then they may incorporate FAA accepted means of compliance PS-AIR-23-09 or request an alternative MOC.

Applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning and coordinate with the SASB when incorporating alternate FAA accepted MOC into their certification planning.
NOTE: Project applications after October 11, 2018 who apply this policy are restricted to class I and II airplanes. Previously, on some projects the FAA, during the developmental policy phases, allowed some approvals using this policy for class III airplanes. This PS-AIR-23-09 policy statement must be used in lieu of project specific policy memos for new applications dated October 11, 2018 and after.

2500 V1.0 Artificial Intelligence Software

If the applicant is proposing to use artificial intelligence (AI) software, then this will require FAA involvement.

References: FAA Advisory Circular (AC) 20-115D, DO-178C.

Applicants should contact the SASB for additional guidance.

2520 V1.1 Electronic Flight Instrument Systems

If the applicant is proposing to install an electronic flight instrument system (EFIS) that has not been previously evaluated by the SASB, then the FAA may require a multi-pilot usability and human factors evaluation.

This evaluation (on past EFIS) have resulted in the need for Equivalent Level of Safety (ELOS) finding(s) or additional FAA accepted means of compliance (MOC) to 14 CFR 23.1309(d), 23.1311, 23.1321 and 23.1322 at amendment 23-63 and prior.

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning in lieu of an ELOS finding.

2525 V1.0 Relief from 14 CFR 23.13111(a)(5)

If the applicant is seeking relief from 14 CFR part 23.13111(a)(5) at amendment 23-49 for installation approval of electronic displays in part 23 airplanes limited to VFR, then they may require an Equivalent Level of Safety (ELOS) finding.
The Small Airplanes Standards Branch have developed policy designed to reduce the burden of processing multiple ELOS requests and communicates the intent of 23.1311(a)(5).

14 CFR 23.2500, 23.2615 at amendment 23-64 and after.
V1.1 Speech Recognition or Voice Activated Technology

If the applicant proposes to install speech recognition or voice activated technology for avionics data entry, then they may need to obtain an FAA accepted means of compliance (MOC) to 14 CFR 23.1301 and 23.1309 at amendment 23-63 and prior.

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning.

V1.0 Touch Screens

If the applicant is seeking to install touch screens (multi-function controls), then they should follow the FAA accepted means of compliance (MOC) contained in the applicable chapters of FAA Advisory Circular AC 20-175, "Controls for Flight Deck Systems."

If the touchscreen has not previously evaluated by the FAA, then the FAA will evaluate their level of involvement in the project.

V1.0 Vision Systems - Synthetic and Enhanced

If the applicant is seeking to install Synthetic Vision Systems (SVS) or Enhanced Vision Systems (EVS), then they must incorporate FAA accepted means of compliance (MOC).

SVS typically uses terrain data from a database to display "synthetic vision" information to the pilot.

EVS is an electronic means to provide a display of the forward external scene topography through the use of imaging sensors, such as forward looking infrared (FLIR), millimeter wave (MMW) radiometry, MMW radar, and/or low-light-level image intensifying.

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning.

If the applicant is seeking to install night vision compatible lighting systems into part 23 airplanes, then they must obtain an FAA accepted means of compliance (MOC) at all amendment levels.

The FAA accepted NVIS MOC is currently available as a Project Specific Policy Memo that may be obtained from the SASB. This MOC defines an acceptable MOC for aided flight operations and aided takeoff and landing operations. This MOC does not address operational authorization.

The project specific policy memo does not currently allow for agricultural application operations and therefore an issue paper will be required. Similarly, aided seaplanes operations are also not covered and will require an issue paper.

If the applicant proposes to use ADS-B Out System and the ADS-B Out pairing is not already on the list of approved sources, then they may need to obtain an FAA accepted means of compliance (MOC) for initial airworthiness approval.

This link below has the list of previously approved sources: https://www.faa.gov/nextgen/equipadsb/installation/equipment/

FAA Advisory Circular 20-165B is an FAA accepted MOC.

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning.

If the applicant is seeking to install a non-functioning cockpit control, then they may be required to apply an Equivalent Level Of Safety (ELOS) to establish adequate requirements at amendment 23-63 or earlier.

At amendment 23-64 and after, applicants should coordinate with the Small Airplane Standards Branch and incorporate the requirements of the ELOS into their certification planning for 14 CFR 23.2500, 23.2505, 23.2605 and 23.2610 as FAA accepted means of compliance (MOC) in lieu of an ELOS.

V1.1 Airspeed Indicator Markings

If the applicant is installing digital avionics (glass cockpit), then they may require an Equivalent Level Of Safety (ELOS) finding when complying with 14 CFR 23.1545 Airspeed Indicator at amendment 23-63 and prior.

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning in lieu of an ELOS finding.

V1.1 Data Link System Supporting Air Traffic Services (ATS) Communications (NEXTGEN)

If the applicant is seeking to install aircraft data communication systems used for air traffic services (ATS), then they must incorporate FAA accepted means of compliance (MOC).

Advisory Circular AC 20-140C, "Guidelines for Design Approval of Aircraft Data Link Communication Systems Supporting Air Traffic Services (ATS)", covers different types of data link systems and interoperability criteria, respectively, is an FAA accepted MOC.

Additionally, policy memorandum, AIR-6B0-17-6B0-DM281, AC 20-140C General Memo, dated December 08, 2017, provides clarification on FANS 1/A+, associated viable sub-networks, and use of operating limitations in the Airplane Flight Manual. Examples of ATS data communication systems are controller pilot data link communications, Automatic Dependent Surveillance-Contract, and Aircraft Communications Addressing and Reporting System. AC 20-140C covers different types of data link systems and interoperability criteria respectively.

Applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning and coordinate with the SASB of their intent to propose an alternative FAA accepted MOC in accordance with AC 23.2010-1, FAA Accepted Means of Compliance Process for 14 CFR Part 23, that can be incorporated into their certification planning.

V1.2 Wireless Local Area Network

If the applicant is incorporating wireless local area network (LAN) in their design, then they must incorporate FAA accepted means of compliance (MOC).

Policy Statement, PS-ACE-23-2, is an FAA accepted MOC.

Applicants should coordinate with the SASB in order to obtain the latest guidance.
NOTE:

1. Use AC 20-164A, in lieu of AC 20-164, an advisory material cited in PS-ACE-23-2: AC 20-164A, "Designing and Demonstrating Aircraft Tolerance to Portable Electronic Devices", provides guidance for aircraft certification applicants to demonstrate that their airplane are tolerant to potential electromagnetic effects from Portable Electronic Device (PEDs).

This AC refers to Radio Technical Commission for Aeronautics (RTCA), Inc. Document No. (RTCA/DO)-307A. This document specifies standard procedures that demonstrate an airplane is tolerant to potential electromagnetic effects from PEDs, including portable wireless RF devices.

2. The FAA is currently coordinating an additional policy statement PS-AIR-25-13-R1, this policy is in draft format. This additional policy statement provides additional policy on demonstrating electromagnetic compatibility (EMC) for wireless radio frequency (RF) systems that are installed on transport category airplanes.

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning.

V1.1 Security Considerations (Cybersecurity)

If the applicant proposes to use wireless connectivity for data transfers to onboard avionics, then they may need to obtain an FAA accepted means of compliance (MOC).

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning.

Policy Statement PS-AIR-21.16-02 Rev 2 is an FAA accepted MOC.

14 CFR 23.2500, 23.2505 and 23.2510 at amendment 23-64 and after.

V1.2 Battery - Rechargeable Lithium/Battery Systems Installation

If the applicant is seeking approval of rechargeable lithium batteries and/or battery systems installation, SASB applies §23.2525 at amendment 23-64 in the areas of change for installing the rechargeable lithium batteries, project existing certification basis amendment level not withstanding.

Per §23.2010, accepted means of compliance, SASB may require a means of compliance issue paper to document the acceptable means of compliance and related safety criteria where previous special condition requirements are incorporated.

V1.1 Battery - Storage Battery

If the applicant proposes to use an aircraft electrical system design that has the storage battery
being used as starter power and emergency power, then they may require an Equivalent Level of Safety (ELOS) finding at amendment 23-63 or earlier to comply with 14 CFR 23.1353(h).

Per this design, the aircraft must use the same battery that is used for engine starting as well as to meet the 30 emergency minute requirement.

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance (MOC) into certification planning in lieu of an ELOS finding.

V1.0 Multi-Core Processors

If the applicant proposes to use software-based aircraft systems that utilize multi-core microprocessors (i.e., without disabling unused cores, etc.), then they must use or obtain an FAA accepted means of compliance (MOC).

V1.1 Balloon - Lifting Envelope Changes

If an applicant is proposing to replace the lifting envelope of a type certificated balloon with another lifting envelope (i.e. via Supplemental Type Certificate), they must retain and reinstall the original data plate and install an additional supplemental data plate as close as physically possible to the original data plate. This information is provided to communicate the requirements of FAA data plate removal and installation of a supplemental data plate for balloon envelope changes as the data plate is typically attached to the lifting envelope. Deviations from this guidance will necessitate SASSB review of the applicant's proposed changes.

This communication is provided due to confusion primarily seen among STC applicants about the appropriate handling of the data plate installed by the original equipment manufacturer and the need for a supplemental data plate.

FAA Order 8130.2J, Section 2-3, paragraph e(2)(c) states: "When an aircraft has been modified to conform to another make/model, verify the supplemental ID plate contains the information specified in 14 CFR part 45.13..."

FAA Advisory Circular, AC 45-2E paragraph 6.7 Notes: "When an aircraft has been modified to conform to another model of the same make, a new ID plate is required to be attached as close as physically possible to the original ID plate. The original ID plate is not to be removed or altered in any manner."

V1.0 Balloon - Control Force Guidance

If the applicant is seeking to comply with 14 CFR 31.49 –at any amendment–, then they must consider balloon control force guidance. A policy memo is available upon request. However, the content of the policy memo is as follows (see below).
Balloon control forces are currently addressed in 14 CFR 31.49, Control Systems, which states in paragraph (a): "Each control must operate easily, smoothly, and positively enough to allow proper performance of its functions. Controls must be arranged and identified to provide for convenience of operation and to prevent the possibility of confusion and subsequent inadvertent operation."

The rules go on to define force limits for the emergency deflation ripcord in 31.57(b) of "not less than 25, or more than 75 pounds." Although the term "rip cord" is not specifically used in 31.55, both sections address the emergency deflation systems. The SASB believes that in the absence of other rational approaches, the control force guidelines in 31.55 should reflect the same force values as in 31.57.

3200 V1.0 Aircraft in Low Earth Orbit (LEO)

If the applicant is seeking to operate an aircraft that will reach low-Earth orbit (LEO) or build a vehicle to operate in LEO, then they are under the jurisdiction of Title 51 U.S.C, Chapter 509, and, depending on their proposed operations may also be subject to Title 49 U.S.C and its accompanying regulations as well.

On September 26, 2013, FAA legal counsel issued an interpretation under FAA’s aviation and space statues to determine which law applies to a potential balloon applicant for a commercial space tourism vehicle (51 U.S.C. or 49 U.S.C).

The balloon applicant in question was determined to be entirely under the jurisdiction of 51 U.S.C. Chapter 509 "partly" because the vehicle would make a rapid transit of and exit from controlled airspace and will not loiter. However... the interpretation only applied to the altitudes being proposed by the specific applicant. When not operating as a launch vehicle, the appliance would be required to operate under the appropriate aviation provision of Title 49 U.S.C. and its accompanying regulations.

NOTE: The legal interpretation rendered no opinion on what constitutes outer space but used 30 kilometers because at 30 kilometers (98,425 feet), water and blood boil, and an unprotected person would rapidly experience fatal decompression. Regardless of whether 30 kilometers constitutes outer space-and the FAA renders no opinion on that question—a person would experience the same physiological responses at 30 kilometers as if exposed to the environment of low-Earth orbit (LEO).

Regulatory Reference: Title 51 U.S.C, Chapter 509

3220 V1.0 Energy/Thrust Management Systems/Displays for Electronic Propulsion

If the applicant proposes to use Energy and/or Thrust Management Systems, then they must coordinate their proposals with the SASB to determine the level of FAA involvement with respect to policy or guidance.

Aircraft designed to incorporate electric propulsion systems, distributed propulsion systems, or operate in different flight modes (vertical, transitory, forward flight) may be required to utilize energy and/or thrust management systems which are new to the Part 23 fleet.

Considerations include the monitoring of battery states, individual thrust vectors (magnitude and direction) as well as malfunction annunciations.

The FAA is actively working on draft policy and guidance for the use of this new and novel technology.
V1.0 Aircraft With Different Flight Modes (Vertical, Transition, Forward Flight) [eVTOL]

If the applicant proposes to design an aircraft to operate in different flight modes (vertical, transitory, and forward flight), then they must coordinate their proposals with the SASB to determine the level of FAA involvement with respect to policy or guidance.

Aircraft like the new class of Vertical Takeoff and Landing (VTOL) vehicles are capable of flying in different modes of flight (vertical, transitory, and forward) and are new to the Part 23 fleet. There are many considerations not currently addressed in our requirements including new pilot vehicle interfaces, new displays for energy and thrust management, handling qualities, and unique malfunction scenarios.

The FAA is actively working on draft policy and guidance for the use of this new and novel technology. The FAA is currently deciding if these vehicles will be 14 CFR 21.17(b) (special class) or 14 CFR 23 with special conditions.

Regulatory Reference: 14 CFR 21.17(b), 14 CFR 23 Amendment 23-64

V1.0 Balloon - Production Flight Test

Applicants should be aware of the policy memo issued by the SASB on February 9, 2000 that states the following:

"There has been a request from the field for guidance on production flight test of balloons. In the absence of any written guidance from the Directorate (now the Small Airplane Standards Branch) concerning production flight test the following is offered.

It has been the industry standard for some time that the FAA approved production flight test checklist can be accomplished during a hot inflation of the tethered balloon. This policy is satisfactory and is approved for use for all approved U.S. balloon manufacturers with a FAA approved production certificate."

The policy memo is available upon request.

Regulatory Reference: 14 CFR part 31 at all amendments

V1.0 Basic Med Operations

If the applicant is seeking to allow 14 CFR part 68 basic med operations in some 14 CFR part 23 airplanes, then they may need to apply for type certificate action either through an amended type certificate or supplemental type certificate (STC) if their airplane is certificated above 6000 pounds maximum take-off weight and/or have seat counts greater than 6.

The FAA has issued a policy memo that addresses these expectations more clearly and that memo is available upon request.

If the applicant proposes to obtain design and production approval for equipment considered to increase airplane safety that incorporates failure modes no greater than minor and is not equipment mandated by regulation, then the design and production approval may be eligible for installation as a minor alteration.

The FAA has developed a policy statement, PS-AIR-21.8-1602, that addresses this subset of non-required safety enhancing equipment (NORSEE) that could be eligible for installation as a minor alteration.

In addition PS-AIR-21.8-1602, (potentially including AOA systems) may be used (with certain conditions) to overcome some of the challenges associated with adding new equipment in older airplanes. The policy is intended to support retrofit of existing aircraft only and does not apply to new production aircraft incorporating AOA systems. This policy does not apply to new or amended TCs or STCs.

The determination of minor alterations is up to the installer and is not addressed by this policy.

The NORSEE policy may be used as a Design and Production Approval for Vendors. These approvals are in lieu of STC and PMA (FAR 21.8d). Some stipulations on the equipment are:

- Non Required Equipment
- Equipment that is a minor change to type Design
- Failure Condition of the equipment is no worse than Minor/Major (i.e. is not Hazardous/Catastrophic)

Once NORSEE approval is granted, an A&P Mechanic needs to determine the Installation process. If the mechanic deems that it is a minor alteration, then only an A&P logbook entry is required.

NOTE: The design specifications for the AOA system are published in ASTM F3011-13 (Standard Specification for Performance of AOA system). The FAA adopted this specification in 2013.

Regulatory Reference: 14 CFR part 21.8(d) and 21.9

If the applicant is seeking to install laser technology in an aircraft, then they may require an FAA accepted means of compliance (MOC) if the technology they propose to install is not addressed in FAA AC 20-183, “Laser Airworthiness Installation Guidance”.

Local, State, and Federal law enforcement agencies use forward looking infrared (FLIR) equipment with laser illuminators, pointers, and range finders for nighttime, covert surveillance.

A LIDAR uses a laser to perform ranging by measuring the reflected return of a projected laser beam. LIDAR devices can be used in mapping terrain elevation, obstacles, and vegetation; or atmospheric measuring (for example, particulate tracking or turbulence monitoring).

At amendment 23-64 and after, applicants should incorporate FAA accepted Means of Compliance into their certification planning.

If the applicant proposes to use distributed propulsion systems, then they must coordinate their proposals with the SASB to determine the level of FAA involvement with respect to policy or guidance.

Highly-augmented, distributed propulsion systems are new to the Part 23 fleet. They are typically defined as a highly-augmented propulsion system consisting of a single throttle controlling a multi-motor system.

The FAA is actively working on draft policy and guidance for the use of this new and novel technology.

If the applicant proposes the use of non-Halon fire extinguishing/suppression agents for use in lavatory trash receptacle bottles, handheld fire extinguishers, engine/APU fire extinguishing, cargo compartment fire suppression, etc., then they may need to obtain an FAA accepted means of compliance (MOC) to 14 CFR 23.851, 23.855, 23.863, 23.1195, 23.1197, 23.1201, at amendment 23-63 and prior.

Halon is being phased out of airplane applications per ICAO deadlines.

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance(MOC) into their certification planning.

If the applicant is seeking to install a nonconformal heads up display, then they must obtain an accepted means of compliance(MOC).

Nonconformal heads-up displays do not take into account external reference information. They act as a repeater to the electrical flight instrument system. They are not considered required equipment but have safety enhancing capability.

14 CFR 23.2600(a) at amendment 23-64 and after.

If the applicant proposes to use Highly Augmented Flight Path Control Systems/Fly By Wire (FBW), then they may require special conditions, Equivalent Level of Safety (ELOS) findings, or may need to obtain FAA accepted means of compliance (MOC) at any part 23 amendment.

FBW control systems are new to the Part 23 fleet and has only been certified to date under Parts 25 & 29 with the use of Special Conditions and Equivalent Levels of Safety.
FBW systems are highly integrated flight controls and propulsion systems that may require new display symbology, and may require new performance and handling quality testing requirements.

The FAA is actively working on draft policy and guidance for the use of this new and novel technology.

3500 V1.0 Life Limits - Damage Tolerance Inspections

If the applicant is proposing to eliminate or extend existing life limits, they must contact the SASB.

Small airplanes may have structural life limits on certain components imposed by the aircraft’s certification basis. Type design holders or STC applicants may propose eliminating the existing life limits and replacing them with damage tolerance based inspection programs, especially as the fleet approaches the life limits.

The FAA believes that it is impractical to develop an adequate inspection program, incorporate damage tolerant design features and materials, and provide sufficient residual strength in an airplane designed and tested for the life limit approach. There exists an unacceptable risk of fatigue cracking beyond the original life limit and an inspection program has limited capability of detecting what may be a relatively large number of cracks as the fleet ages past the original life limit.

The FAA position is that an inspection program cannot eliminate a life limit but it can be used to extend an existing life limit. The FAA may approve an initial life extension of the original life limit with an FAA accepted inspection program.

14 CFR 23.2240, 23.1529 at amendment 23-64 and after.

3580 V1.1 Material Design Values

If the applicant proposes to use material that does not meet 14 CFR 23.613 at amendment 23-63 or prior, then they may require an Equivalent Level of Safety (ELOS) finding.

The use of S-Basis design values (material allowables) do not comply with probability requirements of 14 CFR 23.613(a), (b), and (e), amendment 23-45. This requires that material strength properties be based on a sufficient number of tests to establish a statistical basis for the design values. For single load path structure, 14 CFR 23.613 further requires the design values must be established with a 99 % probability and 95 % confidence (“A” basis) value. For multiple load path structure, the design values must be established with a 90 % probability and a 95 % confidence (“B” basis) value. However, S-Basis design values have an unknown statistical assurance.

Currently, there is no alternate allowed for structure to use statistically determined minimum design values other than “A” or “B” basis. In addition, there is no option to utilize a procurement specification value as a design value verified with receiving inspection test sampling processes.

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance.
(MOC) into their certification planning in lieu of an ELOS finding.

14 CFR 23.2010 at amendment 23-64 and after.

V1.0 Novel, Unique, or Unusual Design Features

If a technology or product change is novel, unique, or has unusual design features, then applicants and ACO staff should contact the applicable standards branch.

Special Conditions are issued if the existing applicable airworthiness standards do not contain adequate or appropriate safety standards for the airplane, airplane engine, or propeller because of novel, unique or unusual design features of the product to be type certificated (refer to 14 CFR 11.19, 21.16, and 21.101(d)). Equivalent Level of Safety (ELOS) findings may also be applicable when literal compliance with an airworthiness standard cannot be shown and compensating factors exist that can be shown to provide an ELOS to the regulation in which an ELOS is sought. (refer to §21.21(b)(1)).

Novel, unique, or unusual design features may include but are not limited to the following issues(s):
1) Materials; 2) Processes; 3) Design feature(s) that would produce an unsafe condition; 4) Significant technology issues that are of controversial design; 5) Unique operational consideration(s); and 6) Other.

When proposing changes to small airplane products certificated prior to amendment 23-64, applicants are encouraged to comply with later provisions of amendment 23-64 when doing so eliminates the need for special conditions or ELOS findings. Complying with amendment 23-64 performance-based requirements, special conditions and ELOS findings formerly required in its prescriptive predecessors—amendment 23-63 or earlier—could be potentially converted to means of compliance (MOC). The provisions and details of those former special conditions and ELOS could be incorporated into the applicant's certification planning as an FAA accepted MOC under the provisions of §23.2010; FAA Accepted Means of Compliance Process for 14 CFR Part 23, thereby, potentially saving a significant amount of time and administrative effort for both the applicant and the FAA.

Regulatory Reference: 14 CFR part 21.16, 21.101(d) and 21.101(f) at all amendment levels

V1.1 Primary Category - Conversion From Part 23

Policy and Innovation Division is aware of recent STC applications by aircraft owners who desire trading a standard airworthiness certificate on a certificated normal category airplane for a special airworthiness certificate-primary category. In each recent case the airplane met the requirements for primary category airplanes at the time of the application. Also in each case, applicants applied for a single use STC for one serial number of a particular airplane model.

A review of applicable regulations and guidance shows the following:

§ 21.24(a) (1) provides the airplane configuration requirements for primary category, which leads to potential eligibility for a special airworthiness certificate-primary category. The ACO should verify that no STCs have been applied to the particular serial number airplane named on the STC application which would result in the airplane not being eligible.

§ 21.184(c) provides for exchanging a standard airworthiness certificate for a special airworthiness certificate-primary category given certain conditions are met.
AC 21-37 provides guidance for compliance with §21.24. Of particular note is the guidance found in section 17(c) regarding the historical difficulty of returning an airplane to a standard airworthiness certificate from a special airworthiness certificate.

AC 21-12C provides guidance on applying for a special airworthiness certificate.

In accordance with § 21.181(a) (1), a special airworthiness certificate-primary category aircraft is effective as long as the maintenance, preventive maintenance, and alterations are performed in accordance with FAR parts 43 and 91 and the aircraft is registered in the United States.

Policy and Innovation Division finds it permissible to issue an STC for a single serial number exchange of a standard airworthiness certificate for a special airworthiness certificate-primary category if compliance with the applicable regulations is shown and applicable guidance is followed.

3660 V1.0 Life Limits - Safe Life Airplanes and Significant Change

Significant Change under 14 CFR 21.101 requires the applicant comply with all applicable rules for the product being changed that are effective on their date of application for the proposed change UNLESS it is determined that compliance to the later requirement is (1) Not in an area affected by the change, (2) Does not significantly contribute the Level of Safety or (3) Is impractical.

Damage Tolerance is part of the latest certification basis for structural changes. However, airplanes that have been originally certificated to Safe Life or Fail Safe requirements need to be reviewed to determine if they can be certificated to Damage Tolerance requirements at the latest rule.

3680 V1.0 Remotely Piloted Systems/ Command & Control (C2) Systems

If the applicant proposes to use Remotely Piloted Systems, then they must coordinate their proposals with the SASB to determine the level of FAA involvement with respect to policy and guidance.

Remotely piloted aircraft are found in the Unmanned Aircraft Systems (UAS) community and are new to the Part 23 fleet. There is UAS guidance for remotely piloted vehicles that includes definitions, specifications and testing requirements for command and control systems but this may have to be modified to adapt it to Part 23 aircraft. Additional considerations include where and how this aircraft is to be operated and whether or not it is carrying passengers.

The FAA is actively working on draft policy and guidance for the use of this new and novel technology.

Regulatory Reference: No rule at any part 23 amendment.
14 CFR 23.2010 at amendment 23-64 and after.
Per 14 CFR 23.3(e), An airplane cannot have both Commuter Category Certification and one or more of Normal, Utility, Acrobatic certification.

Regulatory Reference: 14 CFR 23.3(e) at amendment 23-63 and prior.
14 CFR 23.2005 at amendment 23-64 and after.

Seating configurations are established as part of the aircraft type design and are listed on the Type Certificate Data Sheet (TCDS). Maximum allowable seating configurations may be changed by amending the Type Certificate (TC) or by a Supplemental Type Certificate (STC). The established maximum seating configuration as listed on a TC (on the TCDS) or STC (as a limitation) does not refer to the maximum number of seats occupied, but instead, the maximum number of seats allowed to be installed in the airplane. The limitation is the maximum allowable, not necessarily the number of seats installed in a given airplane. The seating configuration used to dictate aircraft maintenance requirements are determined by the number of allowed seats listed in the TC (TCDS) or STC (limitations). The AFM also states the maximum seating configuration consistent with the TC or STC.

An STC that reduces seat count must actually remove seats from the airplane down to the established maximum number of allowable seats and there should be a limitation on the face of the STC that clearly indicates number of allowable seats installed. If seating is integral to the product (i.e. toilet, divan, bench) it must be (1) placarded that the seat may not be occupied for take-off and landing or (2) it must be counted as part of the total seat count.

Note:

For Part 21.41 limitations are stated on the TCDS (or STC limitation). This is applicable to maximum allowable seating configuration (limitation). At amendment 23-9 and prior seating limitation should be part of TCDS (as indicated by part 21), this is not specifically addressed at amendment 23-9 and prior. At amendment 23-10 through 23-63 §23.1524 and §23.1583 address the maximum permissible seating configurations to be indicated in the TCDS and AFM. At amendment 23-64 seating configurations are addressed in §23.2005 (airplane "level") and §23.2620 (via accepted MOC ASTM 3264-17, section 5.15.1, and ASTM 3174-15, section 4.9). These limitations should be listed on TCDS (or STC) and in AFM.

If the applicant is seeking approval and implementation of single-place side facing seats at amendment 23-63 or earlier based on the requirements of 14 CR 25.562 and §25.785, then they
must coordinate with the SASB to apply special conditions to establish adequate requirements.

If the applicant is seeking approval and implementation of multiple place side facing seats at amendment 23-63 or earlier based on the requirements of 14 CFR 25.562 and §25.785, then they must coordinate with the SASB to request an exemption.

In addition, if the seat installations mentioned above require airbags to meet the requirements of § 25.562 and §25.785 a special condition is required for this as well.

The FAA has developed a policy statement, PS-ANM-25-03-R1 that identifies areas of regulatory compliance.

At amendment 23-64 and after, applicants should coordinate with the SASB to incorporate the requirements of the special conditions into their certification planning as FAA accepted means of compliance (MOC) in lieu of a special condition.

  Reference 14 CFR Part 25 Sections 25.562 (amendment 25-64) and 25.785(amendment 25-64) as referenced in PS-ANM-25-03-R1.
  14 CFR 23.2010 at amendment 23-64 and after.

3820 V1.0 Significant Change - No Small Airplane Standards Branch Involvement

If the applicant is seeking to comply with an amendment earlier than that established on their date of application, then they must provide an argument per AC21.101-1A and this may be documented in their certification plan.

The applicant's certification plan must be reviewed along with a determination on whether the applicant is complying with the latest regulations for the areas of change and if not, then they must provide an argument as to whether the level of safety is not materially improved or that compliance to the latest amendment is impractical.

If a change is considered significant but with NO Small Airplane Standards Branch involvement, then the ACO should follow AC21.101-1A to ensure the process is followed.

Please also see Part 23 Amendment 23-62 Errors corrections to see how to incorporate the challenges associated with the errors discovered in amendment 62 in dealing with amended TCs and new and amended STCs.

3860 V1.0 Unmanned Aircraft Systems - Software and Hardware Design Assurance

If the applicant is seeking to establish the software and airborne electronic hardware (AEH) design assurance airworthiness criteria in accordance with 14 CFR 21.17(b), then they must use or obtain an FAA accepted means of compliance (MOC).

The requirements currently established for Software and AEH design assurance may not be appropriate depending on the Unmanned Aircraft System (UAS) design and concept of operations (CONOPS).
Simple Autopilots

If the applicant is seeking to install simple autopilots, then they should contact the SASB for additional guidance.

14 CFR 23.2505, 23.2510 at amendment 23-64 and after.

Balloon - Tethered Balloon

Applicants should be aware of the policy memo issued by the FAA on May 19, 2004 on whether a tethered balloon is an aircraft.

The memo reads (in part):

"A tethered balloon does not meet either the regulatory or the statutory definitions of an aircraft. The design and intended use of a tethered balloon is to prevent flight, in that it is permanently attached to a cable system that prohibits its independent movement. It cannot ascend, descend, or move laterally except as controlled by the tether cable. The fact that it may be controlled within limited and predetermined parameters, in case of the highly improbable separation of the tethered balloon from its cable, does not change the fact that its design is intended to prevent flight."

This policy memo is available upon request.

Regulatory Reference: 14 CFR 31.17 and 31.20 at all amendment levels.

Airbags

If the applicant is seeking to install airbags on the airframe, then they may need to obtain an FAA accepted means of compliance (MOC) or may be required to apply a special condition.

Applicants should contact the SASB for any updated information or guidance.

Regulatory Reference: No rule at 14 CFR 23 at amendment 23-63 and prior.
14 CFR part 23.2010 at amendment 23-64 and after.

Active Stick Technology

If the applicant proposes to use Active Stick Technology, then they must coordinate their proposals with the SASB to determine the level of FAA involvement with respect to policy or guidance.

Active stick technology is typically associated with Fly By Wire (FBW) control systems are new to the Part 23 fleet. Active stick systems are not covered at Amendment 23-63 and earlier and may require new means of compliance (MOCs) at Amendment 23-64 and later. They may require new inceptor feel characteristics, human qualities, and performance& handling quality testing requirements.

The FAA is actively working on draft policy and guidance for the use of this new and novel technology.
V1.1 Propulsion as a Flight Control Effector

If the applicant is proposing to use propulsion as a flight control effector, then they must coordinate their proposals with the SASB to determine the level of FAA involvement with respect to policy and guidance.

The use of propulsion as a flight control effector is new to the Part 23 fleet. Examples of this unique type of control may be found in a distributed propulsion system or with an aircraft designed to operate in multiple flight modes.

The FAA is actively working on draft policy and guidance for the use of this new and novel technology.

Regulatory Reference:

V1.1 Compliance to Stability Regulations

If the applicant is seeking to show compliance to stability regulations for unlimited acrobatic airplanes, then they may need a special condition for amendment 23-63 or earlier.

At amendment 23-64 and after, applicants should incorporate the requirements of the special condition into their certification planning as an FAA accepted means of compliance (MOC) in lieu of a special condition.

Regulatory Reference:
14 CFR 23.171, 23.173, 23.175, 23.177 at amendment 23-63 and prior.

V1.2 Envelope Protection and Emergency Descent Mode

If the applicant is proposing to install new control functions within the autopilot on a new or existing avionics system which provides automatic stability augmentation and envelope protection or the addition of an emergency descent mode, then they must obtain an FAA accepted means of compliance (MOC).

At amendment 23-64 and after, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning.

Regulatory Reference:
If the applicant proposes to use Run-Time Assurance/Health Monitoring Executive Systems, then they must coordinate their proposals with the SASB to determine the level of FAA involvement with respect to policy and guidance.

Run-Time Assurance/Health Monitoring Executive Systems are high-level monitoring and protection systems and are new to the Part 23 fleet.

The FAA is actively working on draft policy and guidance for the use of this new and novel technology.

If the applicant proposes to use Real-Time Parameter Identification Systems, then they must coordinate their proposals with the SASB to determine the level of FAA involvement with respect to policy and guidance.

Real-Time Parameter Identification Systems are non-deterministic systems used to mathematically model something in real-time and are new to the Part 23 fleet.

The FAA is actively working on draft policy and guidance for the use of this new and novel technology.

If the applicant proposes to use Adaptive Controllers/Autopilots, then they must coordinate their proposals with the SASB to determine the level of FAA involvement with respect to policy or guidance.

Adaptive controllers/autopilots are non-deterministic systems and are new to the Part 23 fleet.

The FAA is actively working on draft policy and guidance for the use of this new and novel technology.

If the applicant is proposing the installation of systems that provide automatic landing capability in a piloted airplane, then they must coordinate with the SASB. Applicants may be required to apply special conditions to establish adequate requirements at 14 CFR part 23 amendment 23-63 or earlier based on the requirements found in 14 CFR 25.1329 (amendment 25-119), or may need to obtain FAA accepted means of compliance (MOC).

AC 25.1329-1C may provide an accepted means of compliance for piloted airplanes. This issue will
likely be in combination with, or installed after an autothrust system.

Autoland capability is also assumed an inherent function installed in UAS and pilotless aircraft, which already have involvement by the Standards Branch staff.

Operator certification (pilot training and maintenance program) is generally required to utilize the autoland function once the type design is approved.

At amendment 23-64 and after, applicants should incorporate the requirements of the special condition into their certification planning as FAA accepted means of compliance (MOC) in lieu of a special condition.

4100 V1.0 Fully Autonomous Flight Control Systems

If the applicant is proposing to use Adaptive Controllers/Autopilots, then they must coordinate their proposals with the SASB to determine the level of involvement the FAA requires with respect to policy or guidance.

Adaptive controllers/autopilots are non-deterministic systems and are new to the Part 23 fleet.

The FAA is actively working on draft policy and guidance for the use of this new and novel technology.

Regulatory Reference: No rule at any part 23 amendment.

14 CFR 23.2010 at amendment 23-64 and after.

4120 V1.0 Emergency Use Only Autoland Systems

If the applicant proposes to add emergency use only functionality that provides for automatic landing of the airplane, then the SASB will be involved in the project.

Note: This functionality is not to be confused with "normal" autoland capability. This functionality provides for autonomous control and landing of the airplane to a system-determined suitable airport. The need for equivalent level of safety (ELOS) findings and corresponding means of compliance (MOC) must be determined on a case-by-case basis for each installation. The FAA has developed draft policy.

The applicant should define the specific intended functions for § 23.1301 compliance, and provide a definition of appropriate failure conditions and classifications for § 23.1309 compliance. The FAA has developed an issue paper template (S-1) to address MOC for these two regulations, up to and including amendment 23-63.

Certain aspects of the emergency use autoland may not be able to be shown to comply with existing pilot-centric 14 CFR part 23 regulations. The applicant should identify the affected regulations and the compensating features that provide for an equivalent level of safety intended by the regulations and request an ELOS finding by the FAA for those aspects. The FAA has developed an issue paper template (S-2) to address the potential regulatory requirements that may need an ELOS.
At amendment 23-64 and after, applicants, applicants should incorporate FAA accepted means of compliance (MOC) into their certification planning in lieu of an ELOS finding.
