SUBJ: En Route Automation Modernization (ERAM)

1. Purpose of This Notice. This notice transmits editorial and content changes to air traffic procedural guidance in FAA Order (FAAO) JO 7110.65, Air Traffic Control related to the waterfall implementation and use of En Route Automation Modernization (ERAM). The guidance contained in this notice supersedes the applicable provisions of FAAO 7110.65 whenever a facility uses ERAM for operational air traffic control services. Facilities shall revert to the current provisions of FAAO 7110.65 during those periods that ERAM is not used operationally for air traffic control services.

2. Audience. This notice is intended for all air traffic personnel at facilities that use ERAM for operational air traffic control services.

4. Explanation of Policy Change. Whenever ERAM is used operationally for air traffic control services, the applicable provisions of FAAO 7110.65, Air Traffic Control, are superseded by the corresponding provisions contained in this notice. Applicable paragraphs contain changes that are both editorial and content in nature. Changes are considered editorial in nature if the only change involves the replacement of a reference to a Host legacy system with its ERAM equivalent with no other change to functions, requirements, or responsibilities. Examples are the replacement of the term “Host,” or “NAS Stage A” with “ERAM” or the replacement of the term “URET” with “EDST” or “URET/EDST.” Changes are considered content in nature if the changes involve a change to a function, requirement, or responsibility. See Appendix A, ERAM Changes to FAA Order 7110.65.

5. Action. Air traffic managers shall ensure that the provisions of this notice are briefed to operations managers, front-line managers, controllers-in-charge and air traffic controllers prior to the first use of ERAM for operational air traffic control services.

6. Distribution. This notice is distributed to Air Traffic Organization (ATO) En Route Safety and Operations Support, Mike Monroney Aeronautical Center, En Route and Oceanic Operations Service Areas, and all Air Route Traffic Control Centers (ARTCCs), except Anchorage ARTCC.

7. Background. Beginning on or about February 2009, the operational use of ERAM for air traffic control services will be implemented at all ARTCCs in the contiguous United States in accordance with a waterfall schedule. The transition from the Host automation system to ERAM is expected to be completed within approximately 18 months. During that transition period, the provisions of this notice will apply only during those times that a facility is using ERAM for operational air traffic control services. For those facilities that have not yet transitioned to ERAM, or for those ERAM facilities that
for any reason, are not using ERAM operationally for air traffic control services, the existing provisions of FAAO 7110.65 shall apply. When all Host facilities have transitioned permanently to ERAM, the provisions of this notice shall be incorporated into a future change to FAAO 7110.65.

8. **Safety Management System.** Appropriate safety management documentation, in accordance with FAAO 1100.161, Air Traffic Safety Oversight, ATO Order 1000.37, Air Traffic Organization Safety Management System, and the ATO Safety Management System Manual, has been completed in support of this notice.

Luis A. Ramirez  
Director of En Route and Oceanic Safety and Operations Support  
Air Traffic Organization  

Date Signed
APPENDIX A. ERAM Changes to FAA Order 7110.65

2-1-6. SAFETY ALERT

Issue a safety alert to an aircraft if you are aware the aircraft is in a position/altitude which, in your judgment, places it in unsafe proximity to terrain, obstructions, or other aircraft. Once the pilot informs you action is being taken to resolve the situation, you may discontinue the issuance of further alerts. Do not assume that because someone else has responsibility for the aircraft that the unsafe situation has been observed and the safety alert issued; inform the appropriate controller.

New

**ERAM**

2-1-6. SAFETY ALERT

Issue a safety alert to an aircraft if you are aware the aircraft is in a position/altitude which, in your judgment, places it in unsafe proximity to terrain, obstructions, or other aircraft. Once the pilot informs you action is being taken to resolve the situation, you may discontinue the issuance of further alerts. Do not assume that because someone else has responsibility for the aircraft that the unsafe situation has been observed and the safety alert issued; inform the appropriate controller.

**EN ROUTE. ERAM: For alerts external to your facility, informing the appropriate controller is only required if the sector is adjacent to yours.**

NEW

No Change

**NOTE**

1. The issuance of a safety alert is a first priority (see para 2-1-2, Duty Priority) once the controller observes and recognizes a situation of unsafe aircraft proximity to terrain, obstacles, or other aircraft. Conditions, such as workload, traffic volume, the quality/limitations of the radar system, and the available lead time to react are factors in determining whether it is reasonable for the controller to observe and recognize such situations. While a controller cannot see immediately the development of every situation where a safety alert must be issued, the controller must remain vigilant for such situations and issue a safety alert when the situation is recognized.

2. Recognition of situations of unsafe proximity may result from MSAW/E-MSAW/LAAS, automatic altitude readouts, Conflict/Mode C Intruder Alert, observations on

No Change

No Change
a PAR scope, or pilot reports.

New

3. Once the alert is issued, it is solely the pilot's prerogative to determine what course of action, if any, will be taken.

a. Issue discrete beacon codes assigned by the computer. Computer-assigned codes may be modified as required.

   No Change

   No Change
2. When an IFR aircraft, or a VFR aircraft that has been assigned a beacon code by the ARTCC computer and whose flight plan will terminate in another facility’s area, cancels ATC service or does not activate the flight plan, sends a remove strips (RS) message on that aircraft via host keyboard, the FDIO keyboard, or call via service F.

No further changes to paragraph

5-2-17. VALIDATION OF MODE C READOUT

Ensure that Mode C altitude readouts are valid after accepting an interfacility handoff, initial track start, track start from coast/suspend tabular list, missing, or unreasonable Mode C readouts. For TPX-42 and equivalent systems ensure that altitude readout is valid immediately after identification. (TCDD-/BANS-equipped tower cabs are not required to validate Mode C readouts after receiving interfacility handoffs from TRACONs according to the procedures in para 5-4-3, Methods, subpara a4.)

New

NOTE-EN ROUTE. A previously validated Mode C may be used for separation when the exceptional vertical rate indicator (an "X" appended to the Mode C readout) is displayed.

No further changes to section

5-3-3. BEACON IDENTIFICATION METHODS

d. EN ROUTE. During narrowband operations, an aircraft may be considered identified when the full data block is automatically associated with the beacon target symbol of an aircraft that is squawking a discrete code assigned by the computer.

No further changes to paragraph

5-3-8. TARGET MARKERS

EN ROUTE

Retain data blocks that are associated with the appropriate target symbol in order to maintain continuous identity of aircraft. Retain the data block until the aircraft has exited the sector or delegated airspace, and all potential conflicts have been resolved; including an aircraft that is a point out. The data block shall display flight identification and
altitude information, as a minimum. The displayed altitude may be assigned, interim, or reported.

New

NEW

ERAM: When you have separation responsibility for an aircraft and a paired track exists, display a full data block (FDB) or an alternate data block (ADB). An enhanced limited data block (ELDB) may be displayed for aircraft in holding when specified in a facility directive.

REFERENCE:

5-4-3. METHODS

a1 thru a2

3. Use automation capabilities.

NOTE-
EN ROUTE. Interfacility handoff capabilities are available that can be manually initiated and accepted when operating on the backup RDP while FDP is available. The backup RDP by itself does not have the capabilities for interfacility handoffs. Therefore, handoffs between facilities must be made via landline voice communications when operating with the backup RDP only.

a4 thru b2

3. The assigned altitude, appropriate restrictions, and information that the aircraft is climbing or descending, if applicable, except when inter/intrafacility directives ensure that the altitude information will be known by the receiving controller.

NOTE-
1. When physically pointing to the target, you do not have to state the aircraft position.

2. Those en route facilities using host software that provides capability for passing interim altitude shall include the specific operations and procedures for use of this procedure in a LOA between the appropriate facilities.

No further changes to paragraph

<td>Delete</td>
</tr>
</tbody>
</table>

**NOTE-**

FTPD is an automation parameter, normally set to 15 miles, that is compared with the tracked target's perpendicular distance from the stored flight plan route. If the track is within the parameter miles, it is eligible for "FLAT tracking." PTUI is an automation parameter, normally set to 3 minutes, that is compared against the difference between the calculated time of arrival and the actual time of arrival over a fix. If the difference is greater than PTUI, the flight plan's stored data will be revised and fix-time update messages will be generated.

### 5-14-9. ERAM COMPUTER ENTRY OF HOLD INFORMATION

a. When an aircraft is issued holding instructions, the delay is ATC initiated, and the EFC is other than “no delay expected”:

1. Enter a hold message.
2. Maintain a paired track.
3. Enter an EFC time via a hold message, the Hold Data Menu, or the Hold View.
4. Enter non-published holding instructions via a hold message or the Hold Data Menu.

**NOTE:**
The ERAM hold message allows automatic calculation and reporting of aggregate delays.

b. Unless otherwise specified in a facility directive, verbally coordinate non-published holding instructions when handing off an aircraft in hold status to another ERAM sector.

c. An EFC time entered into the Hold Data Menu, Hold View, or the hold message constitutes coordination of the EFC.

**REFERENCE:**
FAA Order 7210.3, Par 8-2-9, ERAM Hold Information Facility Directive Requirements

### 5-14-10. ERAM VISUAL INDICATOR OF SPECIAL ACTIVITY AIRSPACE (SAA) STATUS

Sector controllers shall ensure the situation display accurately reflects the status of all SAAs that impact their area of control responsibility. When “SAA DOWN” is displayed in the Outage View, manually create visual indicators on the situation display to reflect changes to airspace status.

**NOTE:**
The “SAA DOWN” message in the Outage View means that SAA status is no longer being updated. The status of each SAA at the time of the failure, whether "on" or "off", will continue to be displayed. Status changes will not be automatically updated on the display until the outage is resolved.

CHAPTER 13. DECISION SUPPORT TOOLS

Section 1. User Request Evaluation Tool (URET)

ERAM

No Change

Section 1. User Request Evaluation Tool (URET) En Route Decision Support Tools (EDST)

HOST

13-1-1. DESCRIPTION

URET is an en route decision support tool that is used by the sector team in performing its strategic planning responsibilities. URET uses flight plan data, forecast winds, aircraft performance characteristics, and track data to derive expected aircraft trajectories, and to predict conflicts between aircraft and between aircraft and special use or designated airspace. It also provides trial planning and enhanced flight data management capabilities.

ERAM

13-1-1. DESCRIPTION

URET/EDST is an en route decision support tool that is used by the sector team in performing its strategic planning responsibilities. URET/EDST uses flight plan data, forecast winds, aircraft performance characteristics, and track data to derive expected aircraft trajectories, and to predict conflicts between aircraft and between aircraft and special use or designated airspace. It also provides trial planning and enhanced flight data management capabilities. **Under ERAM the URET/EDST capabilities constitute the initial En Route decision support tools.**

HOST

13-1-2. CONFLICT DETECTION AND RESOLUTION

a. Actively scan URET information for predicted aircraft-to-aircraft and aircraft-to-airspace alerts.

b. When a URET alert is displayed, evaluate the alert and take appropriate action as early as practical.

ERAM

13-1-2. CONFLICT DETECTION AND RESOLUTION

a. Actively scan URET/EDST information for predicted aircraft-to-aircraft and aircraft-to-airspace alerts.

b. When a **conflict probe** alert is displayed, evaluate the alert and take appropriate action as early
in accordance with duty priorities.
   c. Prioritize the evaluation and resolution of URET alerts to ensure the safe, expeditious, and efficient flow of air traffic.

   **NOTE-**
   URET alerts are based on radar separation standards. Caution should be used when situations include nonstandard formations.

d. When a URET alert is displayed and when sector priorities permit, give consideration to the following in determining a solution:
   
   d1 thru d2

   e. When the URET Stop Probe feature is activated for an aircraft, Conflict Probe for that aircraft shall be restarted before transfer of control, unless otherwise coordinated.

   **NOTE-**
   The requirement in paragraph 13-1-2e does not apply to aircraft entering a non-URET facility.

---

**HOST**

**13-1-3. TRIAL PLANNING**

a. When URET is operational at the sector and when sector priorities permit, use the trial plan capability to evaluate:
