| <b>1 Maintaining Training Syllabi.....</b>                                             | <b>8</b>  |
| <b>2 Applicable Regulations and Guidance .....</b>                                     | <b>8</b>  |
| <b>3 Base Aircraft.....</b>                                                            | <b>9</b>  |
| <b>4 Aircraft Configuration .....</b>                                                  | <b>9</b>  |
| <b>5 Curricula.....</b>                                                                | <b>10</b> |
| 5.1 Standardized Curriculum Interface with the Overall Pilot Training Curriculums..... | 11        |
| 5.1.1 Initial New-Hire Training Curriculum (INH) .....                                 | 11        |
| 5.1.2 Initial Equipment Training Curriculum (IE).....                                  | 12        |
| 5.1.3 Transition Training Curriculum (TRA) .....                                       | 13        |
| 5.1.4 Upgrade Training Curriculum (UPGD) .....                                         | 13        |
| 5.1.5 Recurrent Training Curriculum (REC) .....                                        | 14        |
| 5.1.6 Requalification Training Curriculum (REQ) .....                                  | 15        |
| 5.1.7 Standardized Curriculum Aircraft/Simulator Training Matrix .....                 | 15        |
| <b>6 Course Contents.....</b>                                                          | <b>16</b> |
| 6.1 Course 1 Training Hours Summary .....                                              | 16        |
| 6.3 Operational Procedures .....                                                       | 20        |
| 6.4 Pilot Flying (PF) and Pilot Monitoring (PM) Duties .....                           | 20        |
| 6.5 Training Environment .....                                                         | 20        |
| 6.6 Operational/Simulated Systems Requirements.....                                    | 21        |
| <b>7 Types of Instrument Procedures, Conditions, and Minima to Be Addressed.....</b>   | <b>21</b> |
| 7.1 Guidance for RNAV and ILS Instrument Approaches .....                              | 22        |
| 7.2 WAAS Training Documentation .....                                                  | 22        |
| 7.3 Continuous Descent Final Approach (CDFA) Pilot Knowledge and Training .....        | 22        |
| 7.4 CAT I Qualification .....                                                          | 22        |
| <b>8 Required Navigation Performance (RNP) Training.....</b>                           | <b>22</b> |
| <b>9 Data Link Communications .....</b>                                                | <b>23</b> |
| <b>10 Testing and Checking .....</b>                                                   | <b>23</b> |
| 10.1 Added Type Rating Practical Test §61.157 .....                                    | 23        |
| 10.2 Pilot Testing §135.293 .....                                                      | 24        |
| 10.2.1 Aircraft Knowledge Test Modules §135.293(a)(2) & (3).....                       | 24        |
| 10.2.2 Aircraft Competency Check Modules §135.293(b).....                              | 24        |
| 10.3 Instrument Proficiency Check §135.297.....                                        | 24        |
| 10.4 Seat Dependent Checking .....                                                     | 25        |
| 10.5 PIC Qualification Checking Modules.....                                           | 25        |
| 10.6 SIC Qualification Checking Modules .....                                          | 27        |

|                                                                                             |           |
|---------------------------------------------------------------------------------------------|-----------|
| <b>11 Training Segments .....</b>                                                           | <b>30</b> |
| 11.1 Ground Training Segment.....                                                           | 30        |
| 11.2 Systems Integration.....                                                               | 30        |
| 11.3 Flight Training Segment .....                                                          | 31        |
| 11.4 Seat Dependent Training.....                                                           | 32        |
| 11.5 Training Course Outlines.....                                                          | 33        |
| 11.5.1 Differences Training Curricula.....                                                  | 40        |
| <b>Appendix F – HS-125 Standardized Operating Procedures, Maneuvers, and Callouts .....</b> | <b>42</b> |
| <b>1 Introduction.....</b>                                                                  | <b>43</b> |
| <b>2 Checklists .....</b>                                                                   | <b>44</b> |
| 2.1 Normal Procedures.....                                                                  | 45        |
| 2.1.1 Checklist Initiation.....                                                             | 45        |
| 2.2 One Pilot in Cockpit.....                                                               | 46        |
| 2.3 Both Pilots in Cockpit.....                                                             | 46        |
| 2.3.1 Omission of Checklists .....                                                          | 46        |
| 2.3.2 Actioning Normal Checklists.....                                                      | 46        |
| 2.3.3 Interrupting and Resuming Checklists.....                                             | 47        |
| 2.3.4 Checklist Terminology.....                                                            | 47        |
| 2.4 Challenge/No Response .....                                                             | 48        |
| 2.5 Definitions: .....                                                                      | 48        |
| <b>3 Briefings .....</b>                                                                    | <b>48</b> |
| 3.1 General.....                                                                            | 49        |
| 3.2 Takeoff Briefing and the Go/No Go Decision.....                                         | 51        |
| 3.2.1 Go/No-Go Decision Criteria.....                                                       | 51        |
| 3.2.2 Takeoff Briefing.....                                                                 | 51        |
| 3.3 Arrival/Approach Briefing.....                                                          | 52        |
| <b>4 Philosophy for the Use of Advanced Technology Equipment.....</b>                       | <b>53</b> |
| 4.1 Use of Automation.....                                                                  | 54        |
| 4.1.1 Flight Management System .....                                                        | 55        |
| <b>5 General Callouts/Procedures .....</b>                                                  | <b>56</b> |
| 5.1 Setting up the Flight Deck for an Approach .....                                        | 56        |
| 5.1.2 Stabilized Approach Criteria.....                                                     | 57        |
| 5.1.3 Altitude Changes.....                                                                 | 57        |
| 5.1.4 Heading Changes .....                                                                 | 58        |
| 5.1.5 Altimeter Changes .....                                                               | 58        |
| 5.1.6 Aircraft Control Transfer .....                                                       | 58        |
| 5.1.7 Approach Altitude Call Outs .....                                                     | 58        |
| 5.1.8 Pilot Monitoring (PM) Standard Callouts.....                                          | 58        |
| <b>6 Taxi.....</b>                                                                          | <b>59</b> |
| <b>7 Maneuvers Training .....</b>                                                           | <b>60</b> |
| 7.1 Stalls.....                                                                             | 60        |
| 7.2 Steep Turns .....                                                                       | 61        |
| 7.3 Time Critical Situations .....                                                          | 61        |
| 7.4 Rejected Takeoffs .....                                                                 | 61        |

|                                                                                         |           |
|-----------------------------------------------------------------------------------------|-----------|
| 7.5 Critical Malfunctions in Flight.....                                                | 61        |
| 7.6 Non-Critical Malfunctions in Flight .....                                           | 62        |
| <b>8 Operating Procedures.....</b>                                                      | <b>62</b> |
| 8.1 Takeoff Normal/Crosswind/Lower Than Standard .....                                  | 62        |
| 8.2 Precision Approach.....                                                             | 64        |
| 8.3 Non-Precision (CDFA) .....                                                          | 66        |
| 8.4 Visual Approach .....                                                               | 68        |
| 8.5 One Engine INOP Approach .....                                                      | 69        |
| 8.6 Go Around – 2 Engines.....                                                          | 71        |
| 8.7 Go Around – 1 Engine .....                                                          | 72        |
| 8.8 Rejected Takeoff.....                                                               | 73        |
| 8.9 Engine Failure $\geq V_1$ .....                                                     | 73        |
| 8.10 Emergency Descent .....                                                            | 75        |
| 8.11 EGPWS Terrain/Obstacle Avoidance.....                                              | 76        |
| 8.12 Windshear Warning .....                                                            | 76        |
| 8.13 Stall .....                                                                        | 77        |
| 8.14 No Flap Approach.....                                                              | 78        |
| 8.15 Circling Approach.....                                                             | 78        |
| 8.16 Steep Turns .....                                                                  | 80        |
| 8.17 Inflight Powerplant Shutdown .....                                                 | 81        |
| 8.18 Inflight Powerplant Restart .....                                                  | 81        |
| 8.19 Powerplant Failure During Second Segment.....                                      | 82        |
| 8.20 OEI During Climb to En Route Altitude .....                                        | 83        |
| 8.21 Landing – Normal, Crosswind, Flap Malfunction, OEI, or from Instrument Approach .. | 84        |

## Appendix E – HS-125 Curriculum Document

# HS-125 Standardized Curriculum

## 1 Maintaining Training Syllabi

Parts 135 operators should maintain training syllabi (e.g., initial, upgrade, or recurrent) and other appropriate materials including operational practices and procedures. Training for other personnel must be included where appropriate (e.g., operational control personnel or maintenance). A part 135 standardized curriculum listed in TS specs may be referenced in the part 135 operator's training program as an FAA-published curriculum in accordance with § 135.341 without the need to reproduce a physical copy of the curriculum.

## 2 Applicable Regulations and Guidance

### 3 Base Aircraft

This document sets forth the recommended Training Curricula for HS-125 series aircraft, including the HS-125 Series 800, Hawker 800XP SPZ8000, Hawker 800XP EFIS-86, Hawker 800XP Proline 21, Hawker 850XP, Hawker 900XP, and Hawker 750 variants. The curricula satisfy the aircraft-specific training, testing, and checking requirements of §135.293, §135.297, §135.345, §135.347, and §135.351. A training provider must identify in their standardized curriculum package which aircraft in the series is the base aircraft represented by the flight training equipment to be used, and identify which variants can be trained using the appropriate differences course(s) from the standardized curriculum.

### 4 Aircraft Configuration

This recommended standardized training curriculum addresses the HS-125 aircraft, including the HS-125 Series 800, Hawker 800XP SPZ8000, Hawker 800XP EFIS-86, Hawker 800XP Proline 21, Hawker 850XP, Hawker 900XP, and Hawker 750 variants. Appendix E contains detailed differences training and learning objectives based on the HS-125 Flight Standards Board Report.

## 5 Curricula

The purpose of the training program is to standardize part 135 air carrier curricula delivered by part 142 training centers to meet the training requirements of part 135 subpart H. This training specification is the mechanism with which the TSWG will formalize stakeholder input for each aircraft type, prior to developing a standardized curricula document for each aircraft fleet.

Upon completion of a fleet specific standardized curricula document, the TSWG will recommend that curricula document to the ARAC. The ARAC will either return the document to the TSWG for revision or recommend the document to the FAA for review. When the ARAC recommends a standardized curricula document to the FAA, the FAA will review the recommendations and, if acceptable, publish the standardized curricula at a national level.

The final output of the TSWG design process is a curriculum document for review by the ARAC. The remaining components of the training program are the responsibility of the operator and part 142 training provider.

In scope of the HS-125 Standardized Curriculum:

- Part 135 Curriculum Document

Out of scope:

- Air Carrier Indoc subjects – §135.345(a)(1) and (a)(4)-(8)
- Company Qualification Modules – §135.293(a)(1)&(4)-(8) and §135.299
- Company Specialty Curriculum Modules
- Courseware (including ground and simulator lesson plans)
- Facilities
- Flight Training Equipment
- General Emergency Training - §135.331
- Hazardous Materials Training (Recognition or Will-Carry) - §135.505
- Personnel
- Records

Additionally, this curriculum meets the training requirements for operators with the following authorizations:

- B034 - IFR Class I Terminal and En Route Navigation Using Area Navigation Systems
- B035 - Class I Navigation in US Class A Airspace Using Area or Long-Range Navigation Systems
- C052 - Straight-In, Non-Precision, APV, and Category I Precision Approach and Landing Minima - All Airports
- C063 - Area Navigation (RNAV) and Required Navigation Performance (RNP) Terminal Operations).

- C073 - Using Minimum Descent Altitude (MDA) as a Decision Altitude (DA)/Decision Height (DH).
- C075 - CAT I IFR Landing Minimum - Circling Approaches
- C079 - IFR Lower-than-Standard Takeoff Minima Airplane Operations - All Airports (Part 135)

### ***5.1 Standardized Curriculum Interface with the Overall Pilot Training Curriculums***

The Standardized Curriculum does not include training subjects outside of the aircraft specific training curriculum, such as Basic Indoctrination, Emergency training or other curriculum segments in the certificate holder's FAA Approved Training Program.

The standardized curriculum contains three course footprints which are used to satisfy multiple curriculums described below.

- Course 1 is a long course
- Course 2 is a short course

#### **5.1.1 Initial New-Hire Training Curriculum (INH)**

This training category is for personnel who have no previous experience with the Certificate Holder (CH) (e.g., newly hired personnel). However, it also applies to personnel employed by the CH who have not previously held a flightcrew member duty position with that CH. Initial new-hire training includes basic indoctrination training and training for a specific duty position and aircraft type. Except for a basic indoctrination curriculum segment, the regulatory requirements for initial new-hire and initial equipment training are the same. Since initial new-hire training is usually the employee's first exposure to specific certificate holder's methods, systems, and procedures, it must be the most comprehensive of the categories of training.

For this reason, initial new-hire training is a distinct, separate category of training and should not be confused with initial equipment training. As defined by 8900.1, initial equipment training is a separate category of training.

#### ***Prerequisites and SC Enrollment:***

The pilots will complete all certificate holder basic Indoc training curriculum segments prior to enrollment in the standardized curriculum. The pilot must have completed the certificate holder §135.293(a)(1), and (3)-(8).

For a PIC training course and qualification, the pilot must possess:

1. Unrestricted ATP, or
2. Commercial, Instrument, Multi Engine not limited to centerline thrust, and successfully have passed the ATP Knowledge Test and meet the eligibility requirements of §61.153.

The PIC Curriculum leads to a PIC §135.293 Competency Check and PIC §135.297 Proficiency Check, and additionally is eligible for an ATP and/or PIC Type Rating in accordance with §61.157(f).

For a SIC Curriculum and qualification, the pilot must possess:

1. ATP, or
2. Commercial, Instrument and Multi Engine not limited to centerline thrust

The SIC Curriculum leads to an IFR SIC §135.293 Competency Check and is eligible for an SIC Type Rating in accordance with §61.55(e).

*SC Training Footprint:*

See [Standardized Curriculum Aircraft/Simulator Training Matrix](#).

### **5.1.2 Initial Equipment Training Curriculum (IE)**

This category of training is for personnel who have been previously trained and qualified for a flightcrew member duty position by the certificate holder (i.e., not new hires) and who are being reassigned to a different flightcrew member duty position on a different aircraft type, and the flightcrew member has not been previously trained and qualified by the certificate holder for that flightcrew member duty position and aircraft type. For example, an SIC on a Cessna 400 series is reassigned as a PIC on a G-V.

#### ***Prerequisites and SC enrollment:***

The pilots will complete all certificate holder training curriculum segments prior to enrollment in standardized curriculum. The pilot must have a current §135.293(a)(1), and (3)-(8) for the certificate holder.

For a PIC training course and qualification, the pilot must possess:

1. Unrestricted ATP, or
2. Commercial, Instrument, Multi Engine not limited to centerline thrust, and successfully have passed the ATP Knowledge Test and meet the eligibility requirements of §61.153.

The PIC Curriculum leads to a PIC §135.293 and PIC §135.297 Proficiency Check, and additionally is eligible for an ATP and/or PIC Type Rating in accordance with §61.157(f).

For a SIC Curriculum and qualification, the pilot must possess:

1. ATP, or
2. Commercial, Instrument and Multi Engine not limited to centerline thrust

The SIC Curriculum leads to a IFR SIC §135.293 and is eligible for an SIC Type Rating in accordance with §61.55(e).

SC Training Footprint:

See [Standardized Curriculum Aircraft/Simulator Training Matrix](#).

### **5.1.3 Transition Training Curriculum (TRA)**

This category of training is for a flightcrew member who has been previously trained and qualified for a specific flightcrew member duty position by the certificate holder and who is being reassigned to the same flightcrew member duty position on a different aircraft type. For example, an SIC on a H800 is reassigned as an SIC on a G-V.

#### ***Prerequisites and SC Enrollment:***

The pilots will complete all certificate holder training curriculum segments prior to enrollment in the standardized curriculum. The pilot must have a current 135.293(a)(1), and (3)-(8) for the certificate holder.

For a PIC training course and qualification, the pilot must possess:

1. Unrestricted ATP, or
2. Commercial, Instrument, Multi Engine not limited to centerline thrust, and successfully have passed the ATP Knowledge Test and meet the eligibility requirements of 61.153.

The PIC Curriculum leads to a PIC §135.293 and PIC §135.297 Proficiency Check, and additionally is eligible for an ATP and/or PIC Type Rating in accordance with §61.157(f).

For a SIC Curriculum and qualification, the pilot must possess:

1. ATP, or
2. Commercial, Instrument and Multi Engine not limited to centerline thrust

The SIC Curriculum leads to a IFR SIC §135.293 and is eligible for an SIC Type Rating in accordance with §61.55(e).

SC Training Footprint:

See [Standardized Curriculum Aircraft/Simulator Training Matrix](#).

### **5.1.4 Upgrade Training Curriculum (UPGD)**

This category of training is for a flightcrew member who has been previously trained and qualified as an SIC by the certificate holder and is being reassigned as a PIC to the same aircraft type for which the flightcrew member was previously trained and qualified. For example, an SIC on a G-V is reassigned as a PIC on a G-V.

***Prerequisites and SC enrollment:***

The pilots will complete all certificate holder training curriculum segments prior to enrollment in the standardized curriculum. The pilot must have a current §135.293(a)(1), and (3)-(8) for the certificate holder.

For a PIC training course and qualification, the pilot must possess:

1. Unrestricted ATP, or
2. Commercial, Instrument, Multi Engine not limited to centerline thrust, and successfully have passed the ATP Knowledge Test and meet the eligibility requirements of 61.153.

The PIC Curriculum leads to a PIC §135.293 and PIC §135.297 Proficiency Check, and additionally is eligible for an ATP and/or PIC Type Rating in accordance with §61.157(f).

SC Training Footprint:

See [Standardized Curriculum Aircraft/Simulator Training Matrix](#).

**5.1.5 Recurrent Training Curriculum (REC)**

This category of training is for a flightcrew member who has been trained and qualified by the certificate holder, who will continue to serve in the same duty position and aircraft type, and who must receive recurring training and/or checking within an appropriate eligibility period. Pilots that are not within the eligibility period for recurrent require a requalification curriculum.

***Prerequisites and SC enrollment:***

The pilots will complete all certificate holder training curriculum segments prior to enrollment in SC.

The pilot must have a current §135.293(a)(1), and (3)-(8) for the certificate holder.

The PIC pilot is within §135.293 & §135.297 currency, or

The SIC pilot is within §135.293.

The PIC Curriculum leads to a PIC §135.293 and PIC §135.297 Proficiency Check.

The SIC Curriculum leads to a IFR SIC §135.293 Competency Check.

SC Training Footprint:

Course 2 - Short Footprint

### 5.1.6 Requalification Training Curriculum (REQ)

This category of training is for a flightcrew member who has been trained and qualified by the certificate holder or standardized curriculum but has become unqualified to serve in a particular flightcrew member duty position on an aircraft type due to not having received recurrent ground or flight training and/or a required proficiency check, flight check, line check, or competency check within the appropriate eligibility period. Requalification training is also applicable in the following situations:

- PICs who are being reassigned as SICs on the same aircraft type.

#### ***Prerequisites and SC enrollment:***

The certificate holder will complete all training curriculum segments prior to enrollment in standardized curriculum. The pilot must have a current §135.293(a)(1), and (3)-(8) for the certificate holder.

The PIC Curriculum leads to a PIC §135.293 and PIC §135.297 Proficiency Check.

The SIC Curriculum leads to a IFR SIC §135.293 Competency Check.

SC Training Footprint:

See [Standardized Curriculum Aircraft/Simulator Training Matrix](#).

**NOTE:** §135.299 Qualification is operator specific and not included in this table.

## 6 Course Contents

Each instructor, supervisor or check pilot will certify the proficiency and knowledge of each crewmember upon completion of required training or checking in accordance with §135.323(c). This certification may occur at any time when the instructor believes that the individual has reached the required level of proficiency during his or her scheduled training, provided that all elements and events of the approved training program have been successfully trained.

### 6.1 Course 1 Training Hours Summary

| Course 1         |               |
|------------------|---------------|
| Day 1            | Planned Hours |
| Aircraft General | 1.0           |

|                                                     |                      |
|-----------------------------------------------------|----------------------|
| Aircraft Manuals                                    | 1.0                  |
| Auxiliary Power Unit                                | 1.0                  |
| Electrical                                          | 3.0                  |
| Powerplant                                          | 1.5                  |
| <b>Day 2</b>                                        | <b>Planned Hours</b> |
| Oil System                                          | 0.5                  |
| Fuel System                                         | 1.5                  |
| Hydraulic System                                    | 1.0                  |
| Landing Gear and Brakes                             | 1.0                  |
| Thrust Reverse                                      | 0.5                  |
| Pneumatic and Environmental Systems                 | 1.5                  |
| <b>Day 3</b>                                        | <b>Planned Hours</b> |
| Avionics                                            | 8.0                  |
| <b>Day 4</b>                                        | <b>Planned Hours</b> |
| Ice Protection                                      | 1.0                  |
| Oxygen                                              | 1.0                  |
| Pitot-static System                                 | 0.5                  |
| Flight Controls                                     | 1.5                  |
| Fire and Smoke Detection Protection and Suppression | 0.5                  |
| <b>Day 5</b>                                        | <b>Planned Hours</b> |
| Lighting                                            | 0.5                  |
| Flight Profiles and Maneuvers                       | 2.0                  |
| CRM                                                 | 4.0                  |
| Windshear                                           | 1.0                  |
| <b>Day 6</b>                                        | <b>Planned Hours</b> |
| Weight and Balance                                  | 1.0                  |
| Flight Planning and Performance                     | 2.0                  |
| MEL and CDL                                         | 0.5                  |
| Preflight                                           | 1.5                  |
| Ground School Completion Exam                       | 1.0                  |
| <b>Day 9</b>                                        | <b>Planned Hours</b> |
| SIT 1*                                              |                      |
| <b>Day 10</b>                                       | <b>Planned Hours</b> |
| SIT 2*                                              |                      |
| <b>Day 11</b>                                       | <b>Planned Hours</b> |
| SIT 3*                                              |                      |

### ***1.2 Course 2 Training Hours Summary***

| <b>Course 2</b>  |               |                            |
|------------------|---------------|----------------------------|
| <b>Day 1</b>     | <b>Ground</b> | <b>Systems Integration</b> |

| Go-Around/Rejected Landing                          |       |      |        |
| Landing From a Circling Approach                    |       |      |        |
| Visual Approach (VFR Procedures)                    |       |      |        |
| Windshear escape maneuver during landing            |       |      |        |
| Landing from a No Flap or Nonstandard Flap Approach |       |      |        |

| Simulator Session 3                                         | Brief | Crew | Single |
|-------------------------------------------------------------|-------|------|--------|
| Taxi                                                        | 2.0   | 4.0  | 4.0    |
| Rejected Takeoff                                            |       |      |        |
| Instrument Takeoff                                          |       |      |        |
| Powerplant Failure During Takeoff at V1                     |       |      |        |
| Airframe icing                                              |       |      |        |
| Precision Approach with Powerplant Failure (manual control) |       |      |        |
| Missed Approach - OEI                                       |       |      |        |

|                                                                                             |  |  |  |
|---------------------------------------------------------------------------------------------|--|--|--|
| Precision Approach                                                                          |  |  |  |
| Landing From a Precision Approach                                                           |  |  |  |
| Lower than Standard Minimum Takeoff                                                         |  |  |  |
| Powerplant Failure During Second Segment                                                    |  |  |  |
| OEI Climb to En Route Altitude                                                              |  |  |  |
| Nonprecision Approach                                                                       |  |  |  |
| Approach and Landing with a Powerplant Failure                                              |  |  |  |
| Inflight fire and smoke                                                                     |  |  |  |
| Flight by reference to standby flight instruments, backup instrumentation, or partial panel |  |  |  |
| Emergency evacuation                                                                        |  |  |  |

### ***6.3 Operational Procedures***

Procedures to be used for curriculum development and implementation by training centers will be those outlined in the recommended HS-125 Standardized Maneuvers and Call Outs.

### ***6.4 Pilot Flying (PF) and Pilot Monitoring (PM) Duties***

Crewmembers should be able to perform either PF or PM duties, unless otherwise limited by the operator's policies or aircraft characteristics (e.g., single HUD).

### ***6.5 Training Environment***

Ground curriculum instruction may take place in any combination of four operational environments, as approved by the relevant CMO. In accordance with guidance in the Order 8900.1, a ground school instructor will always be available while distance learning is taking place. Creation of courseware to support the curriculum operating environment is the responsibility of the training provider.

1. Asynchronous distance learning with validation exam upon arrival at the center
2. Synchronous distance learning with validation exam upon arrival at the center
3. On-site computer-based training with ground school completion exam
4. On-site instructor led training with ground school completion exam

Air carriers operating under part 135 and adopting the standardized curriculum may conduct the ground curriculum segment in any operational environment for which the training provider is approved. Flight training curriculum segments will be conducted using regionally relevant airports appropriate to the flight training equipment in use. Training will take place during marginal VMC and IMC conditions, icing and non-icing conditions. Training will include operations in temperatures/elevations sufficient to reduce aircraft performance. Approach training relevant to all installed equipment will be conducted and simulator plans of action will be drafted by each training provider as appropriate to the FTE in use.

### **6.6 Operational/Simulated Systems Requirements**

The training program must contain a flight check in the aircraft or a check in the simulator or training device to the level of proficiency of a pilot in command or second in command, as applicable, in at least the maneuvers and procedures that are capable of being performed in an aircraft simulator or training device.

Flight training and part-task training conducted under the curriculums in this chapter will be accomplished in one of the following FAA-approved devices:

- HS-125 Flight Simulation Training Device (FSTD)
- Other training device, mockup, system trainer, procedures trainer, simulator or training aid

**NOTE:** A current copy of the Statement of Qualification for each FAA-approved FSTD should be available from the 142 Training Center.

## **7 Types of Instrument Procedures, Conditions, and Minima to Be Addressed**

Maneuvers and procedures trained should be tailored to the types of instrument procedures used by the operator, the environment in which they are flown, the airborne and ground equipment required for each type of operation, and any special considerations that may apply. Operating policies, procedures, and documentation applicable to the operator should be used. Training and evaluation should ensure that procedures can be safely flown considering the following factors:

1. Types of instrument procedures used (standard and special, lowest straight-in, or circling minima, if applicable);
2. The operator's manuals, charts, and checklists;
3. Aircraft type(s) model and/or series flown;
4. Flight guidance and/or visual system(s) and their corresponding category(s) of minima for each authorized system;
5. NAVAID(s) and visual aids used (LVO/SMGCS lighting if applicable);
6. Flightcrew procedures used (e.g., PF/PM duties or call-outs);
7. Airport and runway characteristics typically experienced;
8. Nearby critical terrain or obstruction environment;
9. Relevant normal, non-normal, and environmental conditions. Training and evaluation need only be conducted using relevant and representative procedures and conditions as allowed by the flight training equipment used (e.g., a representative mix of day, night, dusk, variable/patchy conditions, representative temperatures, landing runway altitudes, precipitation conditions, turbulence, and icing conditions); and
10. When multiple types of equipment, flight guidance, and/or systems are used (e.g., FD, SVGS, HUD, autoland, RA), training programs should address each combination of equipment and category of minima. For example, if the operator is

authorized to conduct SA CAT I approaches using HUD and CAT II approaches using autoland, training should address each authorized combination separately.

### ***7.1 Guidance for RNAV and ILS Instrument Approaches***

Note: No special crew qualifications, other than those necessary for Area Navigation (RNAV) and Instrument Landing System (ILS) Instrument approaches, are currently specified for WAAS operations. If RNAV approaches are already integrated into a current training program, operators are not required to have a separate program to incorporate localizer performance with vertical guidance (LPV) and LP specific training elements from AC 90-107.

In the absence of a training program, operators should use this guidance to develop their training curriculum and document the training as outlined in subparagraph 9b.

### ***7.2 WAAS Training Documentation***

Parts 135 operators' applications for operational approval to use WAAS without restrictions or limitations on Instrument Approach Procedures (IAPs) should include documentation of the Wide Area Augmentation System (WAAS)-related training provided to flight crews, dispatchers and maintenance personnel, as appropriate.

### ***7.3 Continuous Descent Final Approach (CDFA) Pilot Knowledge and Training***

Pilots should be familiar with the information in AC 120-108 prior to conducting the operations discussed herein. For parts 135 operators, the approved operating procedures and training program should address the elements listed in AC 120-108. A review of applicable portions of the Pilot Knowledge Requirements and Training section in AC 90-100 is also recommended.

### ***7.4 CAT I Qualification***

Training, testing, checking, and evaluation for CAT I are basic to qualification for instrument flight rules (IFR) operations and should be accomplished in conjunction with basic aircraft type, model and/or series qualification. Training, testing, and evaluation should ensure each pilot has the necessary knowledge and skill appropriate to the type of qualification being completed. If CAT I Landing Minima with Reduced Lighting (Runway Visual Range (RVR) 1800) authorization is sought, flight crews must demonstrate proficiency in approaches to authorized minima using the FD, AP, or HUD as applicable.

## **8 Required Navigation Performance (RNP) Training**

Parts 135 operators should have a training program addressing the operational practices, procedures and training items related to Required Navigation Performance (RNP) operations (e.g., initial, upgrade, or recurrent training for flight crew, operational control personnel, and maintenance personnel).

**NOTE:** A separate training program is not required if RNP training is integrated in the current training program. However, the applicant must identify the elements required training elements from AC 90-105 within the existing training program.

## 9 Data Link Communications

Part 135 operators should have a training program addressing the operational practices, procedures, and training items related to data link communication operations (e.g., initial, upgrade, or recurrent training for pilots, operational control personnel, and maintenance personnel). If criteria for training or checking are other than as specified in AC 90-117, the criteria may be found in Flight Standardization Board (FSB) reports applicable to a particular aircraft type.

**NOTE:** A separate training program is not required if data link communication training is integrated in the current training program. However, the applicant must identify the training elements from AC 90-117 within the existing training program.

Parts 135 operators should ensure their process contains training for pilots on equipment requirements, normal and non-normal operations and procedures, and limits of their data link communication capability. Pilots must receive data communications training specific to the avionics suite they will be operating. A common type rating does not guarantee the pilot has received training on the data communications equipment installed on a particular aircraft.

Operators should include the following objectives to ensure appropriate pilot data link communications qualification: (1) Provide necessary pilot knowledge of data link performance-based communication and surveillance concepts, systems, procedures, and skills to properly respond to data link communication clearances and advisories; and (2) Identify human factor issues specific to pilot operation and interaction with the communication software, hardware, and operating environment (e.g., head-down time, situational awareness, or loss of pilot response time in the Required Communication Performance (RCP) specification).

## 10 Testing and Checking

The training program must contain a flight check in the aircraft or a check in the simulator or training device to the level of proficiency of a pilot in command or second in command, as applicable, in at least the maneuvers and procedures that are capable of being performed in an aircraft simulator or training device.

Testing and checking conducted under the training curriculums in this chapter will be accomplished in an FAA-approved FSTD.

### ***10.1 Added Type Rating Practical Test §61.157***

The objective of the added type rating practical test is to ensure the pilot is eligible to receive a HS-125 type rating on his or her ATP Certificate.

The pilot must successfully complete the added type rating practical test qualification segment and receive a HS-125 type rating.

The added type rating practical test may be administered by an FAA Inspector or a contract training provider Training Center Evaluator.

### ***10.2 Pilot Testing §135.293***

The objective of the pilot testing qualification segment is to test the pilot's knowledge of general operating subjects and aircraft-specific systems, procedures and limitations, as well as ensure the pilot possesses the skills necessary to perform the maneuvers and procedures for the operations authorized and appropriate to the category, class and type of aircraft involved.

#### **10.2.1 Aircraft Knowledge Test Modules §135.293(a)(2) & (3)**

The scope of the oral/written portion of the aircraft knowledge test is defined by regulation. The items that will be evaluated during the oral portion of the practical test/proficiency check are specified in the 14 CFR parts and the Airline Transport Pilot (ATP) and Aircraft Type Rating Practical Test Standards for Airplane (ATP PTS). The aircraft knowledge testing modules may be administered by a Standardized Curriculum Check Pilot or FAA Inspector.

Once every 12 calendar months, each pilot qualified in an aircraft type is required to pass a written or oral test on that pilot's knowledge in aircraft-specific areas.

#### **10.2.2 Aircraft Competency Check Modules §135.293(b)**

Every twelve months, a pilot qualified in an aircraft type is required to complete an aircraft competency check in that type of aircraft. The aircraft competency check may include any of the maneuvers and procedures currently required for the original issuance of the particular pilot certificate required for the operations authorized and appropriate to the category, class and type of aircraft involved. The aircraft competency check qualification modules may be administered by a Contract Provider Check Airman or FAA Inspector.

Note: The instrument proficiency check required by §135.297 may be substituted for the aircraft competency check for the type of aircraft used in the check in accordance with §135.293(c).

### ***10.3 Instrument Proficiency Check §135.297***

The objective of the instrument proficiency check qualification segment is to ensure the pilot possesses the knowledge and skills necessary to perform the duties and responsibilities of a PIC under IFR.

The pilot must have completed an instrument proficiency check within the preceding six months to continue IFR revenue operations. If the pilot is assigned to more than one type of aircraft, that pilot must take the instrument proficiency check in each type of aircraft to which that pilot is assigned, in rotation, but not more than one flight check is required during each six-month period.

The instrument proficiency check qualification modules may be administered by a Standardized Curriculum Check Pilot or FAA Inspector.

#### ***10.4 Seat Dependent Checking***

To ensure pilots are qualified for the flightcrew assignment and duty position each pilot will be assigned in the aircraft, pilots should demonstrate proficiency during qualification checking modules as follows:

1. A PIC who is only assigned PF from the left seat will undergo qualification checks from the left seat.
2. A SIC who is only assigned to the right seat will undergo qualification checks from the right seat.
3. A PIC who is assigned to left and right seat duty positions will demonstrate all PF duties from the left seat during qualification and train rejected takeoff, V1 cut, single engine approach to miss, and single engine landing from the right seat.
4. A SIC who is assigned to the left and right seat will demonstrate PF duties during qualification events from the left seat and demonstrate proficiency in all maneuvers required of a PIC.

**NOTE:** A SIC qualified to operate in both seats may document training in both (e.g., Nosewheel Steering Tiller – left seat) but is only required to demonstrate proficiency in the left seat.

#### ***10.5 PIC Qualification Checking Modules***

The qualification segments in this curriculum include the testing and checking modules used to determine successful completion of the applicable curriculum. The pilot must complete the training set forth in the curriculum within the required eligibility period in order to be eligible for a qualification segment.

| <b>Tasks</b>                               | <b>§135.297(c)/<br/>§135.293(a)(2), (b)<br/>PIC Qualification</b> |
|--------------------------------------------|-------------------------------------------------------------------|
| Checking Module: Preflight Inspection      | Per ATP and Type Rating ACS                                       |
| Checking Module: Start Procedures          | Per ATP and Type Rating ACS                                       |

| Checking Module: Engine-out ILS                          | Per ATP and Type Rating ACS                                       |
| Checking Module: Coupled Approach                        | Per ATP and Type Rating ACS                                       |
| Checking Module: Nonprecision Approach                   | Per ATP and Type Rating ACS                                       |
| Checking Module: Second Nonprecision Approach            | Per ATP and Type Rating ACS                                       |
| Checking Module: Missed Approach from an ILS             | Per ATP and Type Rating ACS                                       |
| Checking Module: Second Missed Approach                  | Per ATP and Type Rating ACS                                       |
| Checking Module: Circling Approach                       | Per ATP and Type Rating ACS                                       |
| Checking Module: Normal Landing                          | Per ATP and Type Rating ACS                                       |
| Checking Module: Crosswind Landing                       | Per ATP and Type Rating ACS                                       |

| <b>Tasks</b>                                  | <b>§135.297(c)/<br/>§135.293(a)(2), (b)<br/>PIC Qualification</b> |
|-----------------------------------------------|-------------------------------------------------------------------|
| Checking Module: Landing from an ILS          | Per ATP and Type Rating ACS                                       |
| Checking Module: Landing with an Engine Out   | Per ATP and Type Rating ACS                                       |
| Checking Module: Circling Approach to Landing | Per ATP and Type Rating ACS                                       |
| Checking Module: Rejected Landing             | Per ATP and Type Rating ACS                                       |
| Checking Module: No-flap Approach to Landing  | Per ATP and Type Rating ACS                                       |
| Checking Module: System Malfunction           | Per ATP and Type Rating ACS                                       |
| Checking Module: Maneuver by Partial Panel    | Per ATP and Type Rating ACS                                       |
| Checking Module: Unusual Attitude Recovery    | Per ATP and Type Rating ACS                                       |

### ***10.6 SIC Qualification Checking Modules***

The qualification segments in this curriculum include the testing and checking modules used to determine successful completion of the applicable curriculum. The pilot must complete the training set forth in the curriculum within the required eligibility period in order to be eligible for a qualification segment.

| <b>Tasks</b>                               | <b>SIC Qualification<br/>135.293(a)(2)<br/>and (b)</b> | <b>SIC Qualifications<br/>Checking Modules<br/>added by TSWG<br/>Recommendation:</b> |
|--------------------------------------------|--------------------------------------------------------|--------------------------------------------------------------------------------------|
| Checking Module: Preflight Inspection      | Per ATP and Type Rating ACS                            |                                                                                      |
| Checking Module: Start Procedures          | Per ATP and Type Rating ACS                            |                                                                                      |
| Checking Module: Taxiing/Runway Operations | Per ATP and Type Rating ACS                            |                                                                                      |

| <b>Tasks</b>                                             | <b>SIC Qualification 135.293(a)(2) and (b)</b> | <b>SIC Qualifications Checking Modules added by TSWG Recommendation:</b> |
|----------------------------------------------------------|------------------------------------------------|--------------------------------------------------------------------------|
| Checking Module: Pretakeoff Checks                       | Per ATP and Type Rating ACS                    |                                                                          |
| Checking Module: Normal Takeoff                          | Per ATP and Type Rating ACS                    |                                                                          |

| Checking Module: Takeoff with Powerplant Failure         | Per ATP and Type Rating ACS                    |                                                                          |
| Checking Module: Rejected Takeoff                        | Per ATP and Type Rating ACS                    | X                                                                        |
| Checking Module: Area Departure                          | Per ATP and Type Rating ACS                    | X                                                                        |
| Checking Module: Steep Turns                             | N/A                                            |                                                                          |
| Checking Module: Stall Prevention (Approaches to Stalls) | Per ATP and Type Rating ACS                    | X                                                                        |
| Checking Module: Powerplant Failure                      | Per ATP and Type Rating ACS                    | X                                                                        |
| Checking Module: Area Arrival                            | Per ATP and Type Rating ACS                    | X                                                                        |
| Checking Module: Holding                                 | Per ATP and Type Rating ACS                    | X                                                                        |
| Checking Module: Normal ILS Approach                     | Per ATP and Type Rating ACS                    |                                                                          |
| Checking Module: Engine-out ILS                          | Per ATP and Type Rating ACS                    | X                                                                        |

| <b>Tasks</b>                                  | <b>SIC Qualification 135.293(a)(2) and (b)</b> | <b>SIC Qualifications Checking Modules added by TSWG Recommendation:</b> |
|-----------------------------------------------|------------------------------------------------|--------------------------------------------------------------------------|
| Checking Module: Coupled Approach             | Per ATP and Type Rating ACS                    | X                                                                        |
| Checking Module: Nonprecision Approach        | Per ATP and Type Rating ACS                    |                                                                          |
| Checking Module: Second Nonprecision Approach | N/A                                            |                                                                          |
| Checking Module: Missed Approach from an ILS  | Per ATP and Type Rating ACS                    | X                                                                        |
| Checking Module: Second Missed Approach       | N/A                                            |                                                                          |
| Checking Module: Circling Approach            | Per ATP and Type Rating ACS                    | X                                                                        |
| Checking Module: Normal Landing               | Per ATP and Type Rating ACS                    |                                                                          |
| Checking Module: Crosswind Landing            | Per ATP and Type Rating ACS                    |                                                                          |
| Checking Module: Landing from an ILS          | Per ATP and Type Rating ACS                    | X                                                                        |
| Checking Module: Landing with an Engine Out   | Per ATP and Type Rating ACS                    |                                                                          |
| Checking Module: Circling Approach to Landing | Per ATP and Type Rating ACS                    | X                                                                        |
| Checking Module: Rejected Landing             | Per ATP and Type Rating ACS                    | X                                                                        |
| Checking Module: No-flap Approach to Landing  | N/A                                            |                                                                          |
| Checking Module: System Malfunction           | Per ATP and Type Rating ACS                    |                                                                          |

| <b>Tasks</b>                               | <b>SIC Qualification 135.293(a)(2) and (b)</b> | <b>SIC Qualifications Checking Modules added by TSWG Recommendation:</b> |
|--------------------------------------------|------------------------------------------------|--------------------------------------------------------------------------|
| Checking Module: Maneuver by Partial Panel | Per ATP and Type Rating ACS                    |                                                                          |
| Checking Module: Unusual Attitude Recovery | Per ATP and Type Rating ACS                    |                                                                          |

## 11 Training Segments

The objective of this curriculum is to provide adequate training to enable a pilot to understand the specific airplane systems and performance parameters.

### ***11.1 Ground Training Segment***

The primary objective of aircraft ground training is to provide pilots with the necessary knowledge for understanding the basic functions of aircraft systems, the use of the individual system components and the integration of aircraft systems and operational procedures.

Instruction on each aircraft system must be given in sufficient detail to ensure the pilot clearly understands system components, limitations, relevant controls, actuators, annunciators, and procedures for various system configurations. The pilot will also become familiar with the normal, abnormal and emergency operations of each aircraft system.

### ***11.2 Systems Integration***

Systems integration training provides the pilot with training on how aircraft systems interrelate with respect to normal, abnormal, and emergency procedures. System integration training includes flightcrew interaction in the use of checklists, CRM, and other operational procedures.

Effective systems integration training serves as a logical bridge between conventional ground training instructional delivery methods and flight training. This training allows students to become familiar with the flight deck layout, checklists, operator procedures, and other areas that are best learned before they conduct actual flight maneuvers and procedures. Pilots will perform the tasks listed in the SIT modules under the observation of an instructor or check pilot. Each pilot must demonstrate the associated learning objectives to the listed task expectation rating.

| <b>TASK EXPECTATION RATING</b>     | <b>DESCRIPTION</b>                                                                                                                                                                                                                                                |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Low</b>                         | Trainee may require a significant level of instructor intervention (e.g., demonstrations, explanations, repetitions). Applicable to the first introduction of a task, maneuver or procedure, or where a task is a "train only" item.                              |
| <b>Medium</b>                      | The trainee may require a moderate level of instructor intervention or input. Some limited assistance is required. (e.g., coaching, instructing, prompting) to correct errors or improve task performance.                                                        |
| <b>High</b>                        | Minor instructional inputs, coaching or prompting is sometimes required to enhance task performance. Applicable where the trainee should be able to demonstrate the expected level of task maneuver or procedure proficiency with minimal or no instructor input. |
| <b>Per ATP and Type Rating ACS</b> | The ATP and Type Rating ACS will be used for evaluation purposes for checking and testing during any qualification segment.                                                                                                                                       |

Note: Applied CRM is monitored/practiced in each System Integration Lesson/Flight Simulator/Aircraft Module. Areas of applied CRM include checklist utilization, briefings, decision making, stress management, communications, use of automation, and situational awareness.

### ***11.3 Flight Training Segment***

The primary objective of flight training is to provide an opportunity for pilots to acquire the skills and knowledge necessary to perform to the ATP and Type Rating ACS. This provides for demonstration, instruction and practice of maneuvers and procedures (training events) pertinent to the pilot duty position in the HS-125.

The training flight will emphasize cold and hot weather operations in accordance with the AFM and AOM.

General briefing notes should include: Standards, expectations, SOPs, Crew interactions, overview of events, location of start point, applicable systems, weather, and common errors.

Pilots will perform the tasks listed in in the flight training modules under the observation of an instructor or check pilot. Each pilot must demonstrate the associated learning objectives to the listed task expectation rating.

| <b>TASK EXPECTATION RATION</b>     | <b>DESCRIPTION</b>                                                                                                                                                                                                                                                |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Low</b>                         | Trainee may require a significant level of instructor intervention (e.g., demonstrations, explanations, repetitions). Applicable to the first introduction of a task, maneuver or procedure, or where a task is a "train only" item.                              |
| <b>Medium</b>                      | The trainee may require a moderate level of instructor intervention or input. Some limited assistance is required. (e.g., coaching, instructing, prompting) to correct errors or improve task performance.                                                        |
| <b>High</b>                        | Minor instructional inputs, coaching or prompting is sometimes required to enhance task performance. Applicable where the trainee should be able to demonstrate the expected level of task maneuver or procedure proficiency with minimal or no instructor input. |
| <b>Per ATP and Type Rating ACS</b> | The ATP and Type Rating ACS will be used for evaluation purposes for checking and testing during any qualification segment.                                                                                                                                       |

General debriefing notes should include: Facilitated, ask the crew how they did, preview of the next day, how it was graded.

NOTE: For those curriculums that lead to the issuance of a type rating or an ATP, at least one en route segment must be flown prior to the proficiency check. This segment must include a takeoff and departure from one airport with an arrival and a landing at a second airport. This segment must be flown in real time without repositioning. Normal and abnormal procedures may be accomplished during the en route segment. This module may be used to accomplish the en route segment.

NOTE: Applied CRM is monitored/practiced in each System Integration Lesson/Flight Simulator/Aircraft Module. Areas of applied CRM include checklist utilization, briefings, decision making, stress management, communications, use of automation, and situational awareness.

#### ***11.4 Seat Dependent Training***

Pilots must receive training in seat dependent tasks in accordance with the FSB requirements as follows:

- a) Use of nose wheel steering during taxi
- b) RTO
- c) Crosswind takeoffs and landings
- d) Category (CAT) II/III Operations
- e) Engine Inoperative Landings
- f) Emergency Communications
- g) Loss of all generators

- h) Emergency descent
- i) Operation on emergency power

**NOTE:** A SIC qualified to operate in both seats will document training in both (e.g., Nosewheel Steering Tiller – left seat) but is only required to demonstrate proficiency in the left seat.

**NOTE:** A PIC who is assigned to left and right seat duty positions will demonstrate all PF duties from the left seat during qualification and train rejected takeoff, V1 cut, single engine approach to miss, and single engine landing from the right seat.

### 11.5 Training Course Outlines

The curricula outlines include the planned training hours that will be applied to each curriculum segment. Planned hours for flight training modules do not include preflight/post-flight briefings.

| Course 1                                            |               |        |                     |
|-----------------------------------------------------|---------------|--------|---------------------|
| Day 1                                               | Planned Hours | Ground | Systems Integration |
| Aircraft General, Water and Waste                   | 1.0           | 8.0    |                     |
| Aircraft Manuals                                    | 1.0           |        |                     |
| Auxiliary Power Unit                                | 1.0           |        |                     |
| Electrical                                          | 3.0           |        |                     |
| Powerplant                                          | 2.0           |        |                     |
| Day 2                                               | Planned Hours | Ground | Systems Integration |
| Oil System                                          | 0.5           | 8.0    |                     |
| Fuel System                                         | 1.5           |        |                     |
| Hydraulic System                                    | 1.0           |        |                     |
| Landing Gear and Brakes                             | 1.5           |        |                     |
| Thrust Reverse                                      | 1.0           |        |                     |
| Pneumatic and Environmental Systems                 | 2.5           |        |                     |
| Day 3                                               | Planned Hours | Ground | Systems Integration |
| Avionics                                            | 8.0           | 8.0    |                     |
| Day 4                                               | Planned Hours | Ground | Systems Integration |
| Ice Protection                                      | 1.7           | 8.0    |                     |
| Oxygen                                              | 1.0           |        |                     |
| Pitot-static System                                 | 0.8           |        |                     |

## **Appendix F – HS-125 Standardized Operating Procedures, Maneuvers, and Callouts**

# HS-125 Standardized Curriculum

## 1 Introduction

Standard Operating Procedures (SOPs) are essential to the safety of flight because they provide a common methodology of flying the aircraft. Compliance with SOPs means following the appropriate procedure at the appropriate time. In other words, doing it the right way, every time. SOPs are an important barrier to potential crewmember errors caused by fatigue, distraction, stress, or inattention. Therefore, SOPs create a more reliable crew as these errors are more likely to be captured if nonstandard procedures are introduced into a given flight scenario. In addition, strict adherence to SOPs allows a crew to more effectively manage the flight when unforeseen issues arise such as mechanical irregularities or unexpected weather.

The crew concept is an important element of SOPs. The spirit of Crew Resource Management (CRM) is utilizing all available resources (including cabin staff) to maintain flight safety, by recognizing threats, and preventing threats from becoming errors.

There are external and internal resources available. For example, Air Traffic Control (ATC) is an external resource. ATC can provide important information about weather, traffic, and airport flow management. In addition, a Flight Service Station (FSS) can help with clearances and provide other essential information when contact with ATC is not possible (such as during ground operations).

The crew is the primary internal source of CRM. Communication is the essential element of CRM on the flight deck. Therefore, a crewmember must be able to demonstrate effective oral, non-verbal, and written communications in normal and non-normal situations. Briefings are an example of a strategy used in CRM because they create a shared mental model of how a flight will be managed. In addition to departure and arrival briefings, there are items that can be briefed as needed, in real time during the flight. For example, if a crossing restriction is issued, the pilot flying (PF) should brief the pilot monitoring (PM) how they intend to meet the restriction. Briefings give the PM an opportunity to remind the PF of the plan in case of distractions.

Even though the pilot in command (PIC) is responsible for the conduct of the flight, the second in command (SIC) must offer input to address any questions or concerns regarding the condition and safety of that flight. It's important to remember that each crewmember can communicate identifiable conditions which may interfere with the safe outcome of a flight. Just as the PIC should seek information from an external resource such as ATC, input from the SIC should also be sought. Again, communication and agreement between PIC and SIC are imperative.

Implementation of any procedure as an SOP is most effective when:

- The procedure is appropriate to the situation
- The procedure is practical to use
- Crewmembers understand the reasons for the procedure
- Crewmember duties are clearly delineated

- Effective training is conducted
- Adherence to the standard is emphasized by flight crews, and reinforced by instructors, check pilots, and managers alike
- Crewmembers are aware of the potential risks/hazards if SOPs are not followed

## 2 Checklists

Checklists are tools that support a flight crew's effectiveness in ensuring that all required actions are performed without omission and in an orderly manner. Effective checklists are pertinent and concise. Use them the way they are written—verbatim, smartly, and professionally. Checklists for abnormal/emergency procedures are typically presented in a Quick Reference Handbook (QRH).

Several naming conventions for checklists exist. Regardless of the convention, the execution of checklists falls into two general categories:

- Those that allow for items to be accomplished using a flow, and then verified using the appropriate checklist; and
- Those where each item is actioned in response to a challenge.

If using Flow Patterns, accomplish the cockpit setup for each phase of flight with the desired flow pattern then refer to the checklist to verify the setup. Use normal checklists as “done lists” rather than “do lists.” Flow patterns are disciplined procedures; they require pilots who understand the aircraft systems/controls and who methodically accomplish the flow pattern. For those flight departments who do not use flow patterns, the normal “Challenge -Do-Verify” method may be used.

The **Do-Verify (DV)**, also known as **Challenge and Response**, method consists of the checklist being accomplished in a variable sequence without a preliminary challenge, typically following a flow pattern. These checklists usually relate to the normal operation of the aircraft. Specific critical items are checked /cross-checked, whereby the PM reads the items to be checked and the PF confirms (visually) the proper status/configuration of the appropriate items. The DV method allows the flight crew to use flow patterns from memory to accomplish a series of actions quickly and efficiently. Each individual crewmember can work independently, which helps balance the workload between crewmembers.

The **Challenge-Do-Verify (CDV)**, also known as **Read-and-Do**, method consists of a crewmember making a challenge before an action is initiated, taking the action, and then verifying that the action item has been accomplished. This method is most effective when one crewmember issues the challenge and the second crewmember takes the action and responds to the first crewmember, verifying that the action was taken. This requires that the checklist be accomplished methodically, one item at a time, in an unvarying sequence. These types of checklists usually relate to non-normal (abnormal and emergency)

procedures for which a cockpit flow pattern performed from memory is not suitable.

Mechanical or **electronic checklists** differ in format from paper, hand-held checklists, but not in the design method or use. The actions these checklists contain and their sequencing are consistent with the paper version (when required) available to the flight crew. Some electronic checklists will have an ability to automatically detect the completion of an action based on switch position, system state, or both. In electronic checklists, the verification required may be a matter of observing that the items are complete via the display method used (for example, a completed item turns green).

## **2.1 Normal Procedures**

The normal procedures checklist should be thought of as routine in day-to-day flying. It should be accomplished using the following procedures. The application of a normal procedure checklist should be initiated (called for or requested) by the pilot flying (PF) and then read by the pilot monitoring (PM).

### **2.1.1 Checklist Initiation**

It is the PF's responsibility to call for the checklist at the appropriate time to ensure the aircraft is in correct configuration for that portion of flight. The PM will be responsible for verifying checklist items as appropriate.

If a Flow Pattern is used, the PM will generally accomplish the flow pattern and then verify that the items have been completed using the checklist. The PM then acknowledges completion of the checklist to the PF, stating "checklist complete."

If a challenge-response method is used to execute a checklist, after the PF initiates the checklist, the PM challenges by reading the checklist item aloud. The PF is responsible for verifying that the items designated as PF or seat position (i.e., LH or RH) are accomplished and for responding orally to the challenge.

Items designated on the checklist as PM or by seat position are the PM's responsibility. The PM accomplishes the item, then responds orally to their own challenge. In all cases, the response by either pilot is confirmed by the other and any disagreement is resolved prior to continuing the checklist.

After the completion of any checklist, the PM states "checklist is complete." This allows the PF to maintain situational awareness during checklist phases and prompts the PF to continue to the next checklist, if required.

If the PF fails to initiate a normal checklist at the appropriate time, good CRM practice requires that the PM suggest the initiation of the applicable checklist. Normal procedures

checklist operations should be called for in a timely manner during low-workload periods (conditions permitting) to prevent any undue pressure or possible interruption that could defeat the purpose of the checklist and potentially be detrimental to safety. For example, calling for the Before Takeoff Checklist while the PM is copying the ATC clearance is poor timing and should be avoided.

Situational awareness is not limited to only understanding the time/space relationship of the aircraft, but also includes an awareness of each crew member's current workload. Time and workload management, including the availability of the other pilot to participate, are key factors in the initiation and effective conduct of normal checklists.

## ***2.2 One Pilot in Cockpit***

The Preflight Inspection, Cockpit Preparation, Before Starting Engines and Shutdown checklist may be accomplished by one pilot alone. The Normal Engine Ground Start checklist may also be accomplished by one pilot but this is considered a non-normal procedure. A pilot that completes a checklist alone must advise the other pilot which checklist(s) has/have been completed.

## ***2.3 Both Pilots in Cockpit***

The normal method for conducting checklists in the HS-125 is using "Challenge and Response". Any response that is different from that which is listed indicates something is abnormal and must be challenged by the other crewmember before continuing. In all cases, follow specific company operating procedures when accomplishing checklists in the aircraft. When a response on a checklist is "as required" the appropriate crewmember should respond according to the actual switch position.

### **2.3.1 Omission of Checklists**

While the PF is responsible for initiating checklists, the PM should ask the PF whether a checklist should be started if, in their opinion, a checklist is overlooked. As an expression of good crew resource management, such prompting is appropriate for any flight situation.

### **2.3.2 Actioning Normal Checklists**

Critical items require a response by the PF. Less-critical items may be both challenged, completed, and responded to by the PM alone. To enhance communication and understanding between crewmembers, standard rules and phraseology should be used when conducting normal checklists:

- The challenged crewmember should respond only after verifying the required configuration and correcting any deviations from the correct settings
- If the required configuration is not possible, the challenged crewmember should clearly and completely respond by stating the actual configuration
- The challenging crewmember should always wait for a definitive response (and should cross-check the validity of the response) before moving to the next item

- For all aircraft, the crewmember responsible for reading the checklist should be responsible for ensuring that the checklist is completed systematically and expeditiously. This crewmember should be responsible for managing interruptions, cross-checking the controls and indicators to ensure that the required actions have been accomplished, and for reporting that the checklist has been completed.

**NOTE:** Some checklists include a line that defines a logical hold point to allow partial completion of the checklist. The crew can complete the checklist down to that line and then pause until further action is appropriate, and the remaining checklist items can be meaningfully completed. For those checklists, the PF would initiate the checklist by saying, “(Checklist name) to the line.” Once those items are complete, the PM should state, “(Checklist name) to the line, complete.”

### 2.3.3 Interrupting and Resuming Checklists

If a normal checklist must be interrupted for any reason, the PF should state a clear hold at the specific item in the checklist such as, “Hold checklist at (item).” An explicit call such as, “Resume (continue) checklist at (item),” should be made before the checklist is resumed.

**NOTE:** Upon resuming the normal checklist after an interruption, consideration may also be given by either the PF or PM to starting the entire checklist over, with the possible exception of electronic checklists.

### 2.3.4 Checklist Terminology

Checklist terminology is controlled to ensure clarity and common understanding between crewmembers.

- The challenges and responses on the checklist should be consistent with the labeling on the switches and controls in the cockpit
- Terms such as “tested,” “checked,” and “set” are acceptable terms only when they are clearly defined and consistently used
- This document establishes a consistent policy concerning responses to items with variable settings. “As required” may be printed on the checklist but a response that gives the actual setting is normally appropriate.
  - Items that require variable responses should be carefully evaluated. Such items may not actually be required on the checklist or may be more appropriately included in the system management portion of a checklist.
- With limited exception, when specific quantities are required, a response of “checked” is not acceptable. Responses to checklist items concerning liquid or gas quantities should be made in terms of the actual quantities on board compared to the specific quantity required, for example: “10,000 pounds required, 10,400 on board.”
  - A response of “checked” is acceptable when a range of quantity is permitted

and the range is marked on an indicator, such as a green arc on an oil quantity gauge.

- Excess verbiage on checklists should be discouraged. For example, a checklist item of “Reduce airspeed to 130 KIAS for best glide” can be abbreviated as “BEST GLIDE – 130 KIAS.”
- Ambiguous verbiage on checklists is not acceptable. For example, “takeoff power” can mean either to advance the power or to retard the power.
- Emergency procedures should be clearly defined prior to the first flight of the day to determine each crew member’s responsibilities in the event an emergency or abnormal condition arise during the flight segment(s) (e.g., crew member priorities for passenger handling, aircraft securing, etc.)

### ***2.4 Challenge/No Response***

If the PM observes and challenges a flight deviation or critical situation, the PF should respond immediately. If the PF does not respond by oral communication or action, the PM must issue a second challenge that is loud and clear. If the PF does not respond after the second challenge, the PM must ensure the safety of the aircraft, announce that they are assuming control, and then take the necessary actions to return the aircraft to a safe operating envelope.

### ***2.5 Definitions:***

LH/RH: Pilot Station

- Designation of seat position for accomplishing a given task because of proximity to the respective control/indicator. Regardless of PF or PM role, the pilot in that seat performs tasks and responds to checklist challenges accordingly.
- PF: Pilot Flying
- The pilot responsible for controlling the flight of the aircraft, either manually or through automation monitoring.
- PM: Pilot Monitoring
- The pilot who is monitoring the flight of the aircraft and actions of the PF.
- PIC: Pilot-in-Command
- The Pilot responsible for the operation and safety of an aircraft during flight time.

## **3 Briefings**

Understanding that your fellow crew members do not have an infinite attention span, a long and detailed briefing is of little value if other crew members are task saturated.

Briefings enhance standardization and open communication between flight crewmembers by setting expectations and encouraging participation and teamwork. Effective communication

requires both input and feedback. The ultimate objective is for the flight crew to know and understand the operation, not just cover a rote, generic list of items in each briefing.

A significant difference from prior briefing standards is the intentional identification of threats, and who initiates the identification of threats, relative to each phase of flight. In each briefing, the PM should identify relevant threats for the flight and open the briefing discussion with PF. A threat-based briefing concept, referred to as Threats, Plan, Considerations (TPC) has been designed to allow for the flight crewmembers to generate a discussion applicable to Threat and Error Management (TEM) in each specific phase of flight. Flight crewmembers should conduct TPC briefings in an interactive and collaborative manner, with each flight crewmember given the opportunity to give and receive input. Therefore, it is up to the flight crew to decide, based on professional judgement, what is appropriate to be discussed.

**NOTE:** It is recognized that the number and quality of threats will vary based on each flight-specific scenario, and the briefings will be scaled to account for the variability of the present conditions.

Appendix 1 provides examples of how briefings may be structured to provide a standardized approach to the TPC concept.

### ***3.1 General***

The departure Briefing should always be accomplished during a low stress environment such as on the ramp before aircraft movement. If a runway change occurs during aircraft movement, the aircraft should be stopped when possible and the Takeoff Briefing accomplished with the Parking Brake set. Loading FMS data or accomplishing a Takeoff Briefing while the aircraft is taxiing is not recommended. The Takeoff Briefing has the most variables of any crew briefing. While it is impossible to list every variable, The departure briefing is conducted by the designated PF after the threats have been identified by the PM. It enables the PF to inform the PM of the planned course of actions (e.g., expectations, roles and responsibilities, unique requirements) for both normal and abnormal conditions during takeoff.

A full briefing should be conducted during the first flight of the day. Subsequent briefings may either be abbreviated or expanded to address specific threats and/or aspects of each subsequent flight segment.

The departure briefing should be guided and illustrated by referring to the applicable flight management system (FMS) pages, paper or electronic charts, and the navigation display to visualize the departure route and confirm the applicable data entries. Crews should exercise caution to avoid the element of complacency from detracting from the departure briefing. The briefing should focus on situationally relevant considerations.

Elements of a departure briefing/aircraft set-up should include, but are not limited to, the identified threats and plan(s) to mitigate errors, as applicable, related to:

- Weather information, runway/taxiway in use, and operational factors (such as de-icing information or land-and-hold short operations in effect), and weather required for an air-return or continuation to a takeoff alternate
- Applicable NOTAMs to determine the effect of airport surface closures, construction, NAVAID outages, and airspace restrictions
- Operational impacts of weather to include use of radar, windshear recovery procedures, use of anti-icing systems
- Dispatch conditions affecting takeoff performance such as high temperature operations, cold temperature conversions, or operating in mountainous terrain
- Maintenance logbook (MEL/CDL) to determine operational impact
- Takeoff performance limitations (structural, runway, second segment climb, obstacles) as well as any specific takeoff performance limitations (minimum climb gradient needed)
- Weight and balance data
- Engine-out procedures and departure path/altitude
- Expected takeoff runway, the runway condition and wind component
- Set computed takeoff data for the prevailing conditions including slats/flaps configuration, V-speeds, thrust settings, bleed air configuration, and anti-ice
- Noise-abatement procedure
- Initial altitude, routing, airspeed, airspace restrictions, and any special considerations
- NAVAIDs as required to fly and/or cross-check the departure path including altitude constraints
- Considerations for a rejected takeoff (RTO). Unless prohibited by the OEM, either pilot may call for a rejected takeoff (RTO). The PF will initiate the abort
  - NOTE: In aircraft where a tiller is present and the PF is in a pilot station without access to, or control of, the tiller, the PM will maintain directional control of the aircraft until a safe condition is available to transfer flight controls.
- When operating an aircraft that does not have a door between the flight deck and the passenger compartment, the pilot may need to ask passengers to maintain a sterile cockpit and refrain from unnecessary conversation from the time the preflight preparations begin until the time the aircraft is clear of the terminal area and at cruising altitude. The same procedure should be followed on arrival, from the time landing preparations begin until the aircraft is safely stopped at the terminal.

### **3.2 Takeoff Briefing and the Go/No Go Decision**

#### **3.2.1 Go/No-Go Decision Criteria**

The takeoff phase is arguably the most dangerous phase of aviation. Unlike other decisions in aviation, the Go/No-Go decision to abort or continue a takeoff is almost always irrevocable once it has been made. For this reason, the need for mental preparation based on current conditions cannot be overemphasized. Since conditions can vary greatly, it is best to decide on general guidelines and principles rather than extreme levels of detail:

- The first general guideline is to recall that the only malfunction, for which an aborted takeoff must be accomplished in order to meet performance criteria, is engine failure prior to V<sub>1</sub>. An aborted takeoff for all other malfunctions or conditions is at the discretion of the PIC.
- The second guideline deals with a loss of directional control. This could happen due to many factors including engine failure, thrust reverser deployment, nosewheel steering malfunctions, etc. If any of these events occur, it would be prudent to abort the takeoff. But what if there was an indication of thrust reverser deployment, but no loss of directional control? If the takeoff is on a minimum length runway, it may be prudent to continue the takeoff since no loss of directional control would indicate an erroneous indication.
- The last general guideline is an aircraft deemed unsafe to fly. More than any other, this guideline highlights the many items that could influence the crew's decision to abort a takeoff or continue a takeoff. Given the inherent risks associated with a high-speed abort, great care must be taken when aborting the takeoff for indications alone absent any other evidence of an actual concern about the aircraft's ability to safely become airborne. This is especially critical for those situations where you are runway length limited and is approaching V<sub>1</sub>. Examples include, but are not limited to the following:
  - If the stick shaker is activated just prior to V<sub>1</sub> – is that a truly unsafe condition, or an erroneous angle of attack issue?
  - If multiple tire failures produced high vibration at V<sub>1</sub>, would you continue the takeoff, or try to stop with multiple failed tires?
  - If a red Door Open CAS message illuminates at V<sub>1</sub>, does that make the aircraft unsafe to fly?

Understanding that your fellow crew members do not have an infinite attention span, a long and detailed takeoff briefing is of little value if other crew members are not really listening. A high-speed abort can be a very serious event, and depending on runway length, weather conditions, and runway conditions, the situation can become critical.

#### **3.2.2 Takeoff Briefing**

If not previously briefed and confirmed in the departure briefing, a Takeoff Briefing should be conducted and include the following minimum items:

- Identified threats, plans, and considerations (TPC) to mitigate errors, as applicable
- Departure runway
- Departure procedure
- Power settings
- Speeds
- Abnormal or emergency procedures prior to or after reaching decision speed (i.e., RTO)
- Emergency return intentions
- Expectations of the other crewmember during the takeoff/departure

### ***3.3 Arrival/Approach Briefing***

While approach briefings are a very important part of a safe and effectively flown approach, two human factor realities must be considered: First is that the best briefings are not necessarily defined as the longest briefings. In most cases, short and to the point is better. Second is the attention and stress level of the pilot being briefed. Studies have shown that even at moderate cockpit stress levels, most of a long approach briefing will be tuned out by the other pilot as he/she attempts to manage their stress and prioritize duties.

When setting up for an arrival/approach, a standard briefing format (see below) should be used. Under normal operations, each pilot is responsible for setting up their respective radios and NAVAIDs. The PF briefs the approach/landing after transferring (monitoring) the flight controls to the PM. Emergency operations (or absence of autopilot) may require deviations from this procedure.

After confirming the correct page number and date of the approach, start on the briefing strip at the top of the approach plate, and read across. Read the initial portion of the missed approach strip. Read any special notes pertinent to the approach. End the briefing with required visibility and approach lighting.

An arrival/approach briefing should communicate the following general elements with due consideration to the actual operational situation:

- Identified threats, plans, and considerations (TPC) to mitigate errors, as applicable
- For arrival procedures, a review of lateral and vertical flight path management including published, or ATC assigned speed restrictions
- Runway in use
- Instrument approach procedure identification and details
- Weather information (Operational impacts such as use of radar, anti-ice, windshear)
- Applicable NOTAMs
- Landing performance considerations
- Runway(s)/taxiway(s) in use (surface conditions, wind direction, Deice, LAHSO, etc.)

- Terrain considerations / Obstacle clearance
- Required NAVAIDS
- Minimum altitudes
- Method required to establish aircraft on approach (radar vectors, transition route)
- Lateral and vertical flight path management
- Automation use
- Speed restrictions
- Communication requirements
- Fuel requirements (including alternate fuel)
- Any abnormal procedures such as system malfunctions, MELs
- Missed approach procedure (radar and non-radar procedures)

Following a chart brief, the airport diagram should be reviewed with emphasis on runway conditions, length, landing distance requirements, landing speeds, anticipated turnoff point, anticipated taxi routes, and low-visibility taxi operations. Additionally, if a planned departure from normal SOPs is required to meet an operational requirement, this should be clearly reviewed and discussed during the briefing and prior to commencing the approach.

## 4 Philosophy for the Use of Advanced Technology Equipment

### 1. Fly the aircraft

The flight crew is always responsible, above all else, to fly the airplane. This responsibility cannot be delegated or be allowed to pass unattended to automated equipment.

### 2. Cockpit automation should enhance flight crew situational awareness

The use of cockpit automation should contribute to situational awareness of the flight crew. It should always be managed to increase situational awareness and reduce workload.

### 3. Reversion to manual flight control / navigation

When cockpit automation interferes with situational awareness, automation should be removed and the flight crew should revert to manual flying to the extent necessary to regain situational awareness and maintain safe flight. If the automation is producing a result that is not immediately recognizable as unquestionably accurate, **DO NOT** attempt to diagnose the problem by interacting with the automation **while** the automation is still in control of the aircraft. Remove the automation's control of the aircraft and manually fly the aircraft along the correct lateral and vertical flight path, then the pilot monitoring can diagnose the discrepancy with the automation.

### 4. Confirmation of information

Flight crewmembers should confirm receipt of information from each other, from sources outside the cockpit, and from automated sources. This can be accomplished by read-back, challenge and response, using independent resources, and announcing data from automated

sources. Furthermore, all information and data received should be considered for logic and appropriateness.

## **5. Human-centered automation**

The safe, efficient operation of an aircraft is the sole responsibility of the flight crew. Use of automated equipment should always support the ability of the flight crew to perform required tasks safely and in as low a workload environment as possible. Whether using something as basic as the autopilot, or as advanced as the HUD/EVS, if you don't understand the automation completely, your workload will increase. While there can be no substitution for an extremely high level of proficiency with all of the G550's automation, it should only be used to the extent that it supports the flight crew. Remember, automation is there to serve us. We are not there to serve the automation.

## **6. Guidance Panel Setting**

When hand flying the aircraft, DO NOT make inputs into the Guidance Panel (GP). The PF should command the PM to make the GP inputs that you wish to make. When Autopilot is engaged, the PF should make all GP inputs with the exception of an ATC cleared altitude. An ATC cleared altitude should always be set into the GP Preselect Window by the PM. This methodology keeps both pilots "in the loop" to the greatest degree possible

### ***4.1 Use of Automation***

Automation features vary widely among aircraft. Regardless of the level of automation, the flight crew must be able to master its use, know when it is not working properly, and be able to assume manual control when necessary to maintain safety of flight and situational awareness. Crew coordination is required for successful use of automation. When the autopilot is engaged, the PF shall set all inputs on the Flight Guidance System (FGS), except altitude (or as defined by OEM). When the autopilot is off, the PF shall command all inputs and the PM will set all inputs to the FGS. When mode selections are set or commanded, both crewmembers must confirm that the desired selection has been made. Incorporating flight mode annunciators and flight guidance systems into a scan is essential. If automation is not responding according to expectations, it is important to remove the automation promptly and assume manual control.

The PM accomplishes navigation and communication radio tuning, identification, and ground communication. For navigation radios, the PM tunes and identifies all navigation aids. Before tuning the PF's radios, he announces the NAVAID to be set. In tuning the primary NAVAID, in particular, the PM coordinates with the PF to ensure proper selection sequencing with the autopilot mode. After tuning and identifying the PF's NAVAID (via auto tune feature or manually), the PM announces "(Facility) tuned and identified."

In Hawker aircraft equipped with Pro Line 21 avionics system, monitoring the NDB audio output is not required due to the design of the system, which would bias the needle from view if no valid signal from the NDB transmitter is being received.

In tuning the VHF radios for ATC communication, the PM places the newly assigned frequency in the COM Tune window at the time of receipt. Pressing the appropriate line select key transfers the preselect frequency to the active frequency. After contact on the new frequency, the PM retains the previously assigned frequency for a reasonable time period. Any confusion in the flight deck related to ATC communication is immediately cleared up by requesting ATC confirmation.

#### **4.1.1 Flight Management System**

The crew should review the programmed FMS flight plan prior to starting engines. Normally, the pilot conducting the cockpit setup has programmed the FMS flight plan through either CDU. The flight plan is then displayed for review by both pilots against the dispatch release or ATC clearance routing. Any flight plan errors are corrected at this time.

Once the briefing is complete and both pilots agree with the FMS flight plan, it is cross-filled to the other FMS if operating in the Initiated Transfer mode.

During FMS navigation, both crewmembers should have the FMS mode selected on their Flight Displays. Any underlay information required should be displayed with the bearing pointers. The PFD-CMD mode of the guidance panel (GP) should always be selected to the flying pilot's side. When transitioning from VHF NAV mode to FMS mode or vice versa, the crewmember making the change will state the mode selected.

In the event of a discrepancy between a charted airway or procedure and the FMS database, the chart/map is the final authority. It is the responsibility of the crew to ensure that the FMS guidance conforms to the chart. When the aircraft is operating below 10,000 feet MSL, regardless of autopilot operation, the PF should not program the FMS. Programming should be commanded by the PF to the PM. Above 10,000 feet, with the autopilot on, the PF may elect to provide input to the FMS, provided aircraft control is either transferred to the PM, or a briefing of flight conditions is conducted for the PM to have and maintain situational awareness of the aircraft. All FMS inputs should be verified by both crewmembers.

For arrival and approaches, the appropriate charts should be displayed and readily available. Full NAV/VNAV guidance using the FMS during terminal operations must be limited to situations permitting advance preparations, review of FMS programming and complete crew briefings.

This level of automation is not appropriate when significant changes to route or landing runway have been issued by ATC. In such situations, pilots should revert, at least temporally, to a lower level of automation. All approaches, both FMS Coupled and advisory (FMS data used for situational awareness), should be programmed in the FMS.

FMS Coupled approaches should be flown by using the FMS and the flight guidance system in NAV or Approach mode. Editing the flight plan after the approach label is permitted on advisory approaches only. Editing on an FMS Coupled approach cannot be done without

consequences such as loss of the approach vertical guidance and canceling approach scaling if available.

**WARNING:**

Extreme caution must be exercised by monitoring appropriate annunciators to ensure that the proper navigation information is selected and utilized on each approach.

**NOTE:** The PF will monitor/control the aircraft, regardless of the level of automation employed. The PM will monitor the aircraft and actions of the PF.

## **5 General Callouts/Procedures**

**NOTE:** Changes to the aircraft state by one pilot should not be conducted without prior communication to the other pilot.

### ***5.1 Setting up the Flight Deck for an Approach***

In training as in actual line operations, setting up the flight deck for an approach is a critical step that must be absolutely mastered during training. For this reason, pilots should use the following standardized method of setting up the flight deck for every approach. The acronym **DALCAR** can be useful in remembering the steps to properly load the CDU. After the CDU is loaded, the next items are accomplished in the same order as the approach plate's briefing strip.

- PF/PM obtains current weather and approach in use
- PF commands the PM to set up the approach
- **CDU:**
  - **“D”**estination - PM changes the destination airport (if required)
  - **“A”**rrival - PM selects Arrival, Runway and Approach
  - **“L”**anding - PM selects Landing prompt and fills in all the pages
  - **“C”**ruise Altitude - PM selects cleared altitude in PERF CRUISE (CRZ annunciated between EPR gauges)
  - **“A”**ctivate Vectors - PM selects ACT VECTORS when on radar vectors
  - **“R”**aim - PM checks RAIM, RNP, EPU and any charted temperature limitation if GPS approach

#### **Briefing Strip Items:**

- PM hard selects navaid identifier on both NAV radios via the CDU PROG page (if not already auto-tuned)
- PF/PM sets their respective inbound course (for approaches not coupled to FMS)
- PF/PM sets DA/MDA on their respective PFD

### 5.1.2 Stabilized Approach Criteria

Approach callouts are aircraft specific. These callouts may include configurations, altitudes, and profile information specific to the type. However, all approaches should incorporate and meet stabilized approach criteria.

An approach is considered stabilized when the following criteria are met prior to reaching 1000' (IMC) or 500' (VMC) above TDZE:

- The aircraft is on the correct flight path
- Only small changes in heading/pitch are necessary
- From the final approach fix (point) inbound, maintain the selected airspeed as recommended by the manufacturer at plus/minus 5 knots to designated DA/H or MDA/H.
- The aircraft is in the correct landing configuration
- Sink rate is no greater than 1000 feet/minute; if an approach requires a sink rate greater than 1000 feet/minute, a special briefing should be conducted prior to beginning the approach
- Power/thrust setting is appropriate for the aircraft configuration and is not below the minimum power for the approach
- All briefings and checklists have been conducted

Specific types of approach are stabilized if they also fulfil the following:

- ILS approaches must be flown within one dot of the glideslope and localizer
- Category II or III approach must be flown within the expanded localizer band
- Circling approaches: wings should be level on final prior to 300 feet above touchdown zone elevation; and,
- Unique approach conditions or abnormal conditions requiring a deviation from the above elements of a stabilized approach require a special briefing

Except for circling approaches, non-precision approaches should be conducted using Constant Descent Final Approach (CDFA) procedures unless conditions require and both crew members agree otherwise.

### 5.1.3 Altitude Changes

Prior to any altitude change, ensure the altitude preselector is set to the correct altitude. When passing one thousand feet (1000') to the selected altitude, the PM shall announce the following:

“{xxx} thousand climbing {xxx} thousand”

For example, “5000 climbing 6000” or “Flight level 230 descending flight level 220.”

For aircraft equipped with an EPGWS, there is no need for the crew to echo altitude callouts such as “1000.” However, to maintain situational awareness and prevent over-reliance on automation, the crew should confirm that the information from the EPGWS is consistent with other data available from the primary instruments. In non-EPGWS equipped aircraft, the crew should make callouts as published according to the OEM procedures.

#### **5.1.4 Heading Changes**

When a heading change is required, the PF will announce and set the new heading with the heading selector or direct the PM to set the heading when workload requires. The PM will verbally confirm the heading change matches with the PF announcement. When the PM makes the heading change for the PF, the PF will verbally confirm the heading change matches with the directed change.

#### **5.1.5 Altimeter Changes**

When a new altimeter setting is required (either ATC provided or by passing through the Transition Attitude/Level) the crew will set their respective altimeters and the PM pilot will set the standby altimeter. The altimeters will be crosschecked for accuracy by the crew and verbally verified by stating:

[altimeter setting] “Set and crosschecked”

#### **5.1.6 Aircraft Control Transfer**

The following standard callouts are used when there is a need to transfer aircraft control from one pilot to the other. In addition, the pilot transferring the controls will also state the status of the flight guidance system or aircraft state when flying without the use of automation and the pilot accepting controls will reiterate the aircraft state. Transferring aircraft control should take place in a three-step sequence:

- Pilot transferring control states: “You have the flight controls, heading is 250, altitude is 6000, autopilot is ON, your flight controls...”
- Pilot accepting control states: “I have the flight controls, heading is 250, altitude is 6000, autopilot is ON, my flight controls...”
- Pilot transferring states second time: “You have the flight controls” and visually confirms the other pilot has the controls

#### **5.1.7 Approach Altitude Call Outs**

The minimum expected vertical path callouts on an approach are 1000, 500, 100 to minimums.

#### **5.1.8 Pilot Monitoring (PM) Standard Callouts**

Callouts between crew members is based on the philosophy of not calling out normal items to the greatest extent possible, and only calling out an abnormal situation. This keeps the cockpit

“chatter” to a minimum and allows each crew member to focus on their duties. The following callouts apply generally and are not specific to any maneuver.

|                                                                                     |                                                                                                                                    |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Whenever an ATC cleared altitude is selected in the GP’s altitude preselect window: | PM states the new altitude and points to the preselect window. PF also states the new altitude and points to the preselect window. |
| When one thousand feet prior to the ATC cleared altitude:                           | “XXXX thousand climbing/descending XXXX thousand”                                                                                  |
| When 100 feet prior to the DH, DA, or MDA:                                          | "APPROACHING MINIMUMS" (See Note 1)                                                                                                |
| When at minimums:                                                                   | "MINIMUMS" (See Note 1)                                                                                                            |
| When 100 feet above touchdown zone:                                                 | "ONE HUNDRED" (See Note 1)                                                                                                         |

Note 1: Callout not required if it has been made by the EGPWS.

The following callouts are made by the PM when a deviation from normal is encountered. The response from the PF must always be: “CORRECTING” and then the PF must actually correct the situation. Stating the words “CORRECTING” but not actually correcting should be considered by the PM as a non-response. If there is no response by the PF, the PM must make the deviation from normal callout one more time. If there is still no response from the PF, the PM MUST assume that a subtle incapacitation of the PF has taken place and take control of the aircraft by stating: “I HAVE THE AIRCRAFT.”

|                                                                        |                               |
|------------------------------------------------------------------------|-------------------------------|
| Altitude $\pm$ 100 feet from target:                                   | "ALTITUDE"                    |
| Localizer/Course deviation of 1/2 dot or more:                         | "LOCALIZER"                   |
| Glide path deviation of 1/2 dot or more:                               | "GLIDE SLOPE" or "GLIDE PATH" |
| Airspeed greater than 10 Knots above target:                           | "_____ KNOTS FAST"            |
| Airspeed less than target:                                             | "_____ KNOTS SLOW"            |
| If Airbrakes and Lift Dump are not selected by the PF after touchdown: | "NO AIRBRAKE OR LIFT"         |
| "If Thrust Reverser(s) DO NOT deploy or are not selected by the PF:    | "NO THRUST REVERSERS"         |

## 6 Taxi

Extreme vigilance during taxi operations is required by both crewmembers to reduce the possibility of taxiway or runway incursions. The following procedures should be used as applicable to the operation:

- Identified threats, plans, and considerations (TPC) to mitigate errors, as applicable
- Conduct a pre-taxi/departure briefing that includes the expected taxi route. Review the

airport layout and identify critical areas such as Hot Spots and constructions areas listed in NOTAMs. This briefing is essential to maintain coordination and prevent ground incursions since the crew member who receives the clearance may not be the crew member taxiing the aircraft.

- After taxi clearance has been received, verify the runway assigned, any restrictions, and the taxi route. The use of written taxi instructions is a good operating technique and should be encouraged.
- Have the airport diagram(s) out, available, and in use, to include any low visibility taxi routes depicted. As appropriate, cross check the aircraft heading, airport diagram, and airport signage to confirm aircraft position while taxiing.
- Use aircraft lighting as appropriate for the conditions.
- Use of all available exterior lighting is recommended when crossing a runway
- When crossing taxiways or runways, both crew members should be looking outside the aircraft to scan for traffic. Programming the FMS, running checklists, or other activities that keep the crew inside should be discontinued until the aircraft is in a position of reduced threats or stopped.
- Before crossing active taxiways/runways, the crew will visually verify any intersecting paths for the absence of traffic. Use of TCAS may indicate aircraft on final approach. The left seat pilot will state, “Clear Left” and the right seat pilot will state “Clear Right.”
- When approaching an entrance to an active runway, pilots will ensure compliance with hold short or crossing clearances by discontinuing non-monitoring tasks.
- Prior to crossing or taxiing onto any runway, verbally confirm ATC clearance with other crewmembers and visually scan the runway and approach area. The crew will confirm, per ATC clearance, that they are taxiing onto the correct takeoff runway.
- Once aligned with the assigned runway, the crew should visually and verbally confirm that heading indicator is appropriate for that runway. An aircraft equipped with the Runway Awareness Advisory System (RAAS) may provide this callout provided there is verbal acknowledgment from the crew.
- Read back all clearances/instructions to enter a specific runway, hold short of a runway, and taxi into the “line up and wait” position, including the runway designator.

## **7 Maneuvers Training**

### ***7.1 Stalls***

Stall prevention and recovery should be trained in the following minimum configurations. OEM procedures may require additional training configurations:

- Clean
- Partial Flap (Takeoff Configuration)
- Landing
- High Altitude

Stall prevention will be accomplished in the appropriate phase of flight and in accordance with the OEM's procedures. Stall recovery should be initiated at the first indication of an impending stall. Altitude loss and recovery altitude should be evaluated based on phase of flight. The focus of stall recovery is to manage angle of attack and thrust needed to maintain safe flight.

## ***7.2 Steep Turns***

Steep turns are flown with 45 degrees of bank solely by reference to instruments. The minimum requirement is a turn of at least 180° in both directions. This task must be accomplished without intervention from the PM. Entry speed should be that prescribed by the OEM. In the absence of a manufacturer speed, the ACS should be consulted for applicable standards.

## ***7.3 Time Critical Situations***

When the aircraft, passengers, and/or crew are in jeopardy, remember three things:

FLY THE AIRCRAFT – Maintain aircraft control.

RECOGNIZE CHALLENGE – Analyze the situation.

RESPOND – Take appropriate action.

## ***7.4 Rejected Takeoffs***

The aborted takeoff procedure is a pre-briefed maneuver; both crewmembers must be aware of and briefed on the types of malfunctions that mandate an abort. Assuming that the crew trains to a firmly established SOP, either crewmember may call for an abort.

Regardless of who calls the abort or RTO, the PF will initiate the abort. Reasons for rejecting a takeoff include:

- For Low-Speed Events – Takeoff may be rejected for any non-normal condition
- For High-Speed Events – reject takeoff for engine failure below V1, loss of directional control, or aircraft deemed unsafe to fly. At high speeds, it may be safer to continue the takeoff, even if below V1, based on weather, runway condition, runway length or indications that have no adverse effect on aircraft performance.

**Note:** In aircraft where a tiller is present and the PF is in a pilot station without access to, or control of, the tiller, the PM will maintain directional control of the aircraft until a safe condition is available to transition flight controls to the PF.

## ***7.5 Critical Malfunctions in Flight***

In flight, the observing crewmember positively announces a malfunction. As time permits, the other crewmember makes every effort to confirm/identify the malfunction before initiating any emergency action.

If the PM is the first to observe any indication of a critical failure, the PM announces it and simultaneously identifies the malfunction to the PF by pointing to the indicator/annunciator.

After verifying the malfunction, the PF announces their decision and commands accomplishment of any checklist recall items. The PF monitors the PM during the accomplishment of those tasks assigned to him. It is a common crew practice for the PF to take control of the communications while the PM is performing abnormal and emergency procedures from the QRH.

### 7.6 Non-Critical Malfunctions in Flight

Procedures for recognizing and verifying a noncritical malfunction or impending malfunction are the same as those used for time-critical situations: use positive oral and graphic communication to identify and direct the proper response. Time, however, is not as critical and allows a more deliberate response to the malfunction. Always use the appropriate checklist to accomplish the corrective action.

## 8 Operating Procedures

### 8.1 Takeoff Normal/Crosswind/Lower Than Standard

| LEFT SEAT<br>↓                                              | RIGHT SEAT<br>↓                                 |
|-------------------------------------------------------------|-------------------------------------------------|
| <b><u>TAKEOFF NORMAL/CROSSWIND/LOWER THAN STANDARD</u></b>  |                                                 |
| Cleared for Takeoff                                         |                                                 |
| "CLEAR LEFT"                                                |                                                 |
|                                                             | "CLEAR RIGHT"                                   |
| "LINE UP CHECKLIST"                                         |                                                 |
|                                                             | Complete line-up checklist-                     |
|                                                             | Confirm correct heading and runway alignment    |
|                                                             | "RUNWAY [xx] CONFIRMED"                         |
| SETTING TAKEOFF POWER                                       |                                                 |
| Sets thrust, controls aircraft using tiller & rudder/brakes | controls yoke, inputs wind correction, arms APR |
|                                                             | "LINE UP CHECKLIST COMPLETE"                    |
| 80 knots                                                    |                                                 |
|                                                             | "80 KNOTS CROSSCHECK"                           |
| For a <b>left</b> seat takeoff                              |                                                 |
| "MY YOKE"                                                   |                                                 |
| Tiller hand to yoke                                         | Release yoke                                    |
|                                                             | "YOUR YOKE"                                     |
| For a <b>right</b> seat takeoff                             |                                                 |

|-------------------|-------------------|-----------------------|
| Checklist Trigger | MISSED APPROACH   |                       |
|                   | Gear Selected Up  |                       |
|                   |                   | NAV Source            |
|                   |                   | NAV/HDG Mode          |
|                   |                   | Alt Set/Verified      |
|                   |                   | FLC                   |
|                   |                   | Flaps                 |

## Appendix 1. Briefings

### 1 General.

Briefings enhance standardization and open communication channels between Crewmembers by setting expectations and encouraging all Crewmembers to participate and act as a team. Effective communication requires both input and feedback. The ultimate objective is for the Crew to know and understand the operation, not just cover bullet items of the briefings. It is up to the Crew to decide, in your professional judgement, what needs to be discussed in any given situation.

Briefings also conduct relevant information in an interactive and collaborative manner, providing each crewmember the opportunity to give input. Broader perspective and items are included below, however the following format will be followed when conducting a TPC briefing:

- **Threats.** Reference the Threat table (in the TPC (EXPANDED POLICY), below). This list is not all inclusive, but it is directed towards the most common Safety needs, and Operational Risks These will change as threats change and are to be used as a starting point.
- **Plans.** Brief relevant Plan items. These are listed on Normal Procedures Checklist as they are more likely to be relevant.
- **Considerations.** Considerations are how the crew will close the loop and pick up anything that did not fit in the aforementioned “Threats and Plans.”

Re-brief as necessary any changes to items previously briefed and encourage other Crewmembers to verbalize deviations from the briefed plan.

### 2 TPC (Expanded Policy)

#### 2.1 Threats

A general list of common threats applicable to flight operations is listed in Figure 1-1. This list is not all inclusive but is comprised of common industry safety and operational risks. These risks may change as threats are identified, reported, and analyzed by the TSWG through operator’s voluntary ASAP and SMS reporting.

| THREATS                                |                                            |                                            |
|----------------------------------------|--------------------------------------------|--------------------------------------------|
| AIRPORT/RUNWAY                         | ATC                                        | OPS/DISPATCH/MX                            |
| <input type="checkbox"/> Contamination | <input type="checkbox"/> Clearance changes | <input type="checkbox"/> Schedule pressure |
| <input type="checkbox"/> Construction  | <input type="checkbox"/> Departure/arrival | <input type="checkbox"/> Open squawks      |
| <input type="checkbox"/> Hotspots      | <input type="checkbox"/> Runway changes    | <input type="checkbox"/> Release changes   |
|                                        |                                            |                                            |
| ADVERSE WX                             | AIRCRAFT                                   | ENVIRONMENT                                |
| <input type="checkbox"/> Visibility    | <input type="checkbox"/> Systems           | <input type="checkbox"/> Terrain (GPWS)    |
| <input type="checkbox"/> Cold/hot      | <input type="checkbox"/> MELs              | <input type="checkbox"/> Night operations  |
| <input type="checkbox"/> Winds         | <input type="checkbox"/> Automation        | <input type="checkbox"/> Traffic (TCAS)    |

|                                            |                                                |                                               |
|--------------------------------------------|------------------------------------------------|-----------------------------------------------|
| <input type="checkbox"/> Turbulence/precip | <input type="checkbox"/> Performance           | <input type="checkbox"/> Uncontrolled airport |
|                                            |                                                |                                               |
| <b>GROUND/FBO</b>                          | <b>PHYSIOLOGY</b>                              | <b>CABIN/SERVICE</b>                          |
| <input type="checkbox"/> Catering          | <input type="checkbox"/> Fatigue               | <input type="checkbox"/> Passengers           |
| <input type="checkbox"/> Wing walkers      | <input type="checkbox"/> Situational awareness | <input type="checkbox"/> Technology (WiFi)    |
| <input type="checkbox"/> Delays            | <input type="checkbox"/> Nutrition             | <input type="checkbox"/> Stock/cleaning       |

## 2.2 Plan

The PF should collaborate with the PM on designing a plan to mitigate each identified threat. Briefings will then include any relevant Plan strategies.

## 2.3 Considerations

Considerations are discussed to close the loop between identified Threats and expected Plan(s) of action to either:

- Identify any items that were not previously included in the Threats and Plan discussion
- Identify any new threats introduced with the plan strategy(ies)

Re-brief as necessary any changes to items previously briefed and encourage other non-flying flight crewmembers (when available) to verbalize deviations from the briefed plan.

## Appendix G – HS-125 Learning Objectives

# HS-125 Standardized Curriculum

# 1 Overview – Course 1

## 1.1 Course 1 Training Hours Summary

| HS-125 Course 1                                     |               |        |                     |
|-----------------------------------------------------|---------------|--------|---------------------|
| Day 1                                               | Planned Hours | Ground | Systems Integration |
| Aircraft General, Water and Waste                   | 1.0           | 8.0    |                     |
| Aircraft Manuals                                    | 1.0           |        |                     |
| Auxiliary Power Unit                                | 1.0           |        |                     |
| Electrical                                          | 3.0           |        |                     |
| Powerplant                                          | 2.0           |        |                     |
| Day 2                                               | Planned Hours | Ground | Systems Integration |
| Oil System                                          | 0.5           | 8.0    |                     |
| Fuel System                                         | 1.5           |        |                     |
| Hydraulic System                                    | 1.0           |        |                     |
| Landing Gear and Brakes                             | 1.5           |        |                     |
| Thrust Reverse                                      | 1.0           |        |                     |

| Emergency evacuation                                                                        |       |      |        |

## 2 Ground School Learning Objectives – Course 1

### 2.1 Course 1 – Ground School Learning Objectives

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                     |                                                                                                                                                   |
|-----------------------------------------------------|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                               | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                         |
| Aircraft General, Water and Waste                   | Understand Crew and Passenger Emergency Equipment - survival gear   | Can explain the location, purpose and operation of emergency equipment in the aircraft                                                            |
| Aircraft General, Water and Waste                   | Understand Crew and Passenger Emergency Equipment - emergency exits | Can describe the operation of the airplane systems and components using correct terminology                                                       |
| Aircraft General, Water and Waste                   | Understand Crew and Passenger Emergency Equipment - emergency exits | Can explain all notes cautions or warnings listed in the OEM manuals & OEM manuals                                                                |
| Aircraft General, Water and Waste                   | Understand Crew and Passenger Emergency Equipment - emergency exits | Can use the appropriate checklists and ABNORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem, or device |
| Aircraft General, Water and Waste                   | Understand evacuation procedures and crew duties                    | Can use the appropriate checklists and ABNORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem, or device |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                        |                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------|------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Aircraft General,<br>Water and Waste                       | Understand Crew and Passenger Emergency<br>Equipment - emergency exits |                                                                                                                                                                                                                                                                                     |
| Aircraft General,<br>Water and Waste                       | Understand Crew and Passenger Emergency<br>Equipment - emergency exits |                                                                                                                                                                                                                                                                                     |
| Aircraft General,<br>Water and Waste                       | Understand Crew and Passenger Emergency<br>Equipment - emergency exits |                                                                                                                                                                                                                                                                                     |
| Aircraft General,<br>Water and Waste                       | Understand evacuation procedures and crew<br>duties                    |                                                                                                                                                                                                                                                                                     |
| Aircraft General,<br>Water and Waste                       | Understand installed equipment and furnishings                         | Can describe normal and<br>abnormal operation of the<br>aircraft exits, galleys, water<br>and waste systems, lavatories,<br>cargo areas, crewmember and<br>passenger seats, bulkheads,<br>seating and/or cargo<br>configurations, and<br>nonemergency equipment and<br>furnishings. |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                      | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Aircraft General, Water and Waste                   | Understand Specific Flight Characteristics | Can describe Any aircraft characteristics relevant to all weather operations, such as flight deck visibility cutoff angles and the effect on flight deck visibility of proper eye height, seat position or instrument lighting intensities related to transition through areas of varying brightness levels. Pilots should be aware of the effects on flight visibility related to use of different flap settings, approach speeds, use of various landing or taxi lights, and proper procedures for use of windshield wipers and rain repellent. If windshield defog, anti-ice, or de-icing systems affect forward visibility, pilots should be aware of those effects and be familiar with proper settings for use of that equipment related to low-visibility landing. |
| Aircraft General, Water and Waste                   | Understand Specific Flight Characteristics | Can describe Visual reference information and address aircraft geometry limitations on visual references, actions to take with loss or partial loss of visual references, risks of inappropriate use of visual references, and necessary visual references for continuation after MDA or DA/DH. Issues discussed in Chapter 4, Procedures, for continuation or discontinuation of an approach should be comprehensively addressed.                                                                                                                                                                                                                                                                                                                                        |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                                           |                                                                                   |

| Aircraft Manuals                                           | Understand Crew and Passenger Emergency Equipment - emergency exits                                       | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Electrical System -batteries                                                                   | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Electrical System - alternators                                                                | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Electrical System - generators                                                                 | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Electrical System - circuit breakers and protection devices                                    | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Electrical System - controls                                                                   | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Electrical System - indicators                                                                 | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Electrical System - external and auxiliary power sources. (ground power and APU)               | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Lighting                                                                                       | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Pitot Static System - associated instruments and the power source for those flight instruments | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Pitot Static System - Operation and power sources for other flight instruments                 | Can obtain information from OEM manuals with regard to the systems and components |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                                          |                                                                                   |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                                             | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                              |
| Aircraft Manuals                                           | Understand Avionics and communications - autopilot                                                       | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Avionics and communications - Electronic Flight Instrument Systems (EFIS)                     | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Avionics and communications - Flight Management System (FMS)                                  | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Avionics and communications - Radar                                                           | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Avionics and communications - Inertial Navigation Systems (INS)                               | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Avionics and communications - Global Navigation Satellite System (GNSS)                       | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Avionics and communications - ground-based navigation systems and components                  | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Avionics and communications - transponder                                                     | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Avionics and communications - Automatic Dependent Surveillance – Broadcast (ADS-B) In and Out | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Avionics and communications - ADS – Contract (ADS-C)                                          | Can obtain information from OEM manuals with regard to the systems and components |

| <b>COURSE 1</b>                                            | <b>TASKS</b>                                              | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                              |
| Aircraft Manuals                                           | Understand Fuel system - fuel grade                       | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Fuel system - additives                        | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Fuel system - fueling and defueling procedures | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Hydraulic system - capacity                    | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Hydraulic system - pumps                       | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Hydraulic system - pressure                    | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Hydraulic system - reservoirs                  | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Hydraulic system - allowable types of fluid    | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Hydraulic system - regulators/accumulators     | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Landing Gear - extension/retraction system     | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Landing Gear - indicators                      | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Landing Gear - brakes                          | Can obtain information from OEM manuals with regard to the systems and components |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                 |                                                                                   |
|------------------------------------------------------------|-----------------------------------------------------------------|-----------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                    | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                              |
| Aircraft Manuals                                           | Understand Landing Gear - antiskid                              | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Landing Gear - tires                                 | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Landing Gear - nosewheel steering                    | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Landing Gear - shock absorbers                       | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Flight Controls - Ailerons                           | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Flight Controls - elevator                           | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Flight Controls - rudder                             | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Flight Controls - control tabs                       | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Flight Controls - control boost/augmentation systems | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Flight Controls - flaps                              | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Flight Controls - spoilers                           | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Flight Controls - leading edge devices               | Can obtain information from OEM manuals with regard to the systems and components |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                              |                                                                                   |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                                 | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                              |
| Aircraft Manuals                                           | Understand Flight Controls - speed brakes                                                    | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Flight Controls - stability augmentation system (e.g., yaw damper)                | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Flight Controls - trim systems                                                    | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Ice Protection - anti-ice & de-ice.                                               | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Ice Protection - pitot-static system protection                                   | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Ice Protection windshield                                                         | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Ice Protection airfoil surfaces                                                   | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Pneumatic and environmental system - heating, cooling, ventilation                | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Pneumatic and environmental system - pressurization                               | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Pneumatic and environmental system - supply for ice protection systems            | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Pneumatic and environmental system - controls, indicators, and regulating devices | Can obtain information from OEM manuals with regard to the systems and components |
| Aircraft Manuals                                           | Understand Crew and Passenger Equipment - oxygen system                                      | Can obtain information from OEM manuals with regard to the systems and components |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                                                                                                                                                                            |                                                                                                                                                                                    |
|------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                                                                                                                                                                               | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                               |
| Aircraft Manuals                                           | Understand Crew and Passenger Equipment - quick donning oxygen mask for crewmembers                                                                                                                                                        | Can obtain information from OEM manuals with regard to the systems and components                                                                                                  |
| Aircraft Manuals                                           | Understand Crew and Passenger Equipment - passenger oxygen system                                                                                                                                                                          | Can obtain information from OEM manuals with regard to the systems and components                                                                                                  |
| Aircraft Manuals                                           | Understand Envelope protection—angle of attack warning and protection and speed protection                                                                                                                                                 | Can obtain information from OEM manuals with regard to the systems and components                                                                                                  |
| Aircraft Manuals                                           | Understand Avionics and communications - GPS instrument approach procedures with localizer performance with vertical guidance and localizer performance without vertical guidance lines of minima using the wide area augmentation system  | Can obtain required navigation equipment for approach operations using WAAS or any operational restrictions/limitations, as outlined in the AFM, RFM, AFMS, OpSpec, MSPEC, or LOA. |
| Aircraft Manuals                                           | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that AFM guidelines supersede all other information                                                                                                                    |
| Auxiliary Power Unit                                       | Understand Auxiliary Power Unit (APU)                                                                                                                                                                                                      | Can demonstrate familiarization with the contents of OEM manuals with regard to the systems and components                                                                         |
| Auxiliary Power Unit                                       | Understand Auxiliary Power Unit (APU)                                                                                                                                                                                                      | Can describe the operation of the airplane systems and components using correct terminology                                                                                        |
| Auxiliary Power Unit                                       | Understand Auxiliary Power Unit (APU)                                                                                                                                                                                                      | Can explain system or component limitations                                                                                                                                        |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                    |                                                                                                                                                   |
|------------------------------------------------------------|------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                       | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                              |
| Auxiliary Power Unit                                       | Understand Auxiliary Power Unit (APU)                                              | Can explain all notes cautions or warnings listed in the OEM manuals & OEM manuals                                                                |
| Auxiliary Power Unit                                       | Understand Auxiliary Power Unit (APU)                                              | Can explain immediate action items or memory items, if appropriate                                                                                |
| Auxiliary Power Unit                                       | Understand Auxiliary Power Unit (APU)                                              | Can use the appropriate checklists and NORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem or device    |
| Auxiliary Power Unit                                       | Understand Auxiliary Power Unit (APU)                                              | Can use the appropriate checklists and ABNORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem, or device |
| Auxiliary Power Unit                                       | Understand Auxiliary Power Unit (APU)                                              |                                                                                                                                                   |
| Auxiliary Power Unit                                       | Understand Auxiliary Power Unit (APU)                                              |                                                                                                                                                   |
| Auxiliary Power Unit                                       | Understand Auxiliary Power Unit (APU)                                              |                                                                                                                                                   |
| Auxiliary Power Unit                                       | Understand Auxiliary Power Unit (APU)                                              |                                                                                                                                                   |
| Avionics and Communications                                | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that RNAV 1 requires a total system error of not more than 1 nautical mile (NM) for 95 percent of the total flight time.              |
| Avionics and Communications                                | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that RNAV 2 requires a total system error of not more than 2 NM for 95 percent of the total flight time                               |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                    |                                                                                                                                                                                                                                                           |
|-----------------------------------------------------|------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                              | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                 |
| Avionics and Communications                         | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that Receiver Autonomous Integrity Monitoring (RAIM) is a technique used within a GPS receiver/processor to monitor GPS signal performance and is achieved by a consistency check among redundant measurements.                               |
| Avionics and Communications                         | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that an Instrument Departure Procedure (DP) is a published instrument flight rules (IFR) procedure providing obstruction clearance from the terminal area to the en route structure.                                                          |
| Avionics and Communications                         | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that a SID is a published IFR air traffic control (ATC) DP providing obstacle clearance and a transition from the terminal area to the en route structure.                                                                                    |
| Avionics and Communications                         | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that an obstacle Departure Procedure (ODP) is a preplanned IFR DP printed for pilot use in textual or graphic form to provide obstruction clearance via the least onerous route from the terminal area to the appropriate en route structure. |
| Avionics and Communications                         | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that a Standard Terminal Arrival (STAR) is a published IFR ATC arrival procedure that provides a transition from the en route structure to the terminal area                                                                                  |
| Avionics and Communications                         | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that an RNAV route within the high or low altitude structure of the contiguous United States, is designated by a “Q” or “T”                                                                                                                   |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                    |                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------|------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                              | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                |
| Avionics and Communications                         | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that operation on U.S. RNAV routes, DPs and STARs relies on normal descent profiles and identifies minimum segment altitude requirements                                                                                                                                                                                                     |
| Avionics and Communications                         | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that pilots operating aircraft with an approved barometric vertical navigation (baro-VNAV) system may continue to use their baro-VNAV system while executing U.S. RNAV routes, DPs, and STARs, however operators must ensure compliance with all altitude constraints as published in the procedure by reference to the barometric altimeter |
| Avionics and Communications                         | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that operation on U.S. RNAV routes, DPs and STARs does not require the pilot to monitor ground-based Navigational Aids (NAVAID) used in position updating unless required by the Airplane Flight Manual (AFM), pilot's operating handbook (POH), or the operating manual for their avionics                                                  |
| Avionics and Communications                         | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that operation on U.S. RNAV routes, DPs and STARs bases obstacle clearance assessments on the associated required RNAV system performance                                                                                                                                                                                                    |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                    |                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------|------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                              | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                    |
| Avionics and Communications                         | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that the onboard navigation data must be current and appropriate for the region of intended operation and must include the navigation aids, waypoints, and relevant coded terminal airspace procedures for the departure, arrival, and alternate airfields.                                                                                      |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS)            | Can explain that at system initialization, pilots must confirm the navigation database is current and verify the aircraft's present position.                                                                                                                                                                                                                |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS)            | Can explain that RNAV DP and STAR procedures must be retrieved by procedure name from the onboard navigation database and conform to the charted procedure                                                                                                                                                                                                   |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS)            | Can explain that whenever possible, RNAV routes should be extracted from the database in their entirety, rather than loading RNAV route waypoints from the database into the flight plan individually. Selecting and inserting individual, named fixes from the database is permitted, provided all fixes along the published route to be flown are inserted |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS)            | Can explain that manual entry of waypoints using latitude/longitude or place/bearing is not permitted                                                                                                                                                                                                                                                        |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS)            | Can explain that pilots must not change any RNAV DP or STAR database waypoint type from a flyby to a flyover or vice versa.                                                                                                                                                                                                                                  |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                         |                                                                                                                                                                                                                                |
|-----------------------------------------------------|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                   | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                      |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS) | Can explain that flightcrews should crosscheck the cleared flight plan against charts or other applicable resources, as well as the navigation system textual display and the aircraft map display, if applicable              |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS) | Can explain the importance of verification of assigned route and correct entry of transitions into RNAV System/FMS                                                                                                             |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS) | Can explain the importance of verifying their aircraft navigation system is operating correctly and the correct runway and DP (including any applicable en route transition) are entered and properly depicted prior to flight |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS) | Can explain the importance of verifying proper entry of their ATC assigned route upon initial clearance and after any subsequent change of route.                                                                              |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS) | Can explain the importance of verifying their aircraft navigation system is operating correctly and the transition and arrival runway is entered and properly displayed                                                        |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------|-------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                   | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS) | Can explain that manually selecting aircraft bank limiting functions may reduce the aircraft's ability to maintain its desired track and are not recommended. Pilots should recognize manually selectable aircraft bank-limiting functions might reduce their ability to satisfy ATC path expectations, especially when executing large angle turns. This should not be construed as a requirement to deviate from AFM procedures; rather, pilots should be encouraged to limit the selection of such functions within accepted procedures |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS) | Can explain that DPs and STARs are flown as RNAV 1 procedures. RNAV routes are flown as RNAV 2 unless otherwise specified                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS) | Can explain that For DPs, the pilot must be able to engage RNAV equipment to follow flight guidance for lateral RNAV no later than 500 feet above airport elevation.                                                                                                                                                                                                                                                                                                                                                                       |
| Avionics and Communications                         | Understand Avionics and communications - Flight Management System (FMS) | Can explain that pilots must use a lateral deviation indicator (or equivalent navigation map display), flight director and/or autopilot in lateral navigation mode on RNAV 1 routes. The full-scale course deviation indicator (CDI) deflection value of $\pm 1$ NM is acceptable                                                                                                                                                                                                                                                          |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------------|------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                       | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS)            | Can explain that pilots of aircraft without GPS/GNSS, using DME/DME/IRU, must ensure the aircraft navigation system position is confirmed, within 1,000 feet, at the start point of takeoff roll. The use of an automatic or manual runway update is an acceptable means of compliance with this requirement. A navigation map may also be used to confirm aircraft position, if pilot procedures and display resolution allow for compliance with the 1,000-foot tolerance requirement |
| Avionics and Communications                                | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that the pilot must notify ATC of any loss of the RNAV capability, together with the proposed course of action. If unable to comply with the requirements of an RNAV procedure, pilots must advise ATC as soon as possible.                                                                                                                                                                                                                                                 |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS)            | Can describe the depiction of waypoint types (flyover and flyby) and path terminators                                                                                                                                                                                                                                                                                                                                                                                                   |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS)            | Can describe the required navigation equipment for operation on RNAV routes, DPs, and STARs (for example, DME/DME/IRU and GPS/GNSS)                                                                                                                                                                                                                                                                                                                                                     |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS)            | Can describe system specific levels of automation, mode annunciations, mode changes, alerts, interactions, reversions and degradation                                                                                                                                                                                                                                                                                                                                                   |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                         |                                                                                                                                                                |
|------------------------------------------------------------|-------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                            | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                           |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS) | Can describe the functional interaction with other aircraft systems                                                                                            |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS) | Can describe the meaning and appropriateness of route discontinuities as well as related flightcrew procedures                                                 |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS) | Can describe the monitoring procedures for each phase of flight (for example, monitor PROG or LEGS page)                                                       |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS) | Can explain the types of navigation sensors (for example, DME, IRU, GPS/GNSS) utilized by the RNAV system and associated system prioritization/weighting/logic |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS) | Can explain turn anticipation regarding speed and altitude effects                                                                                             |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS) | Can describe proper interpretation of electronic displays and symbols                                                                                          |
| Avionics and Communications                                | Understand Avionics and communications - autopilot                      | Can describe the operation of the airplane systems and components using correct terminology                                                                    |
| Avionics and Communications                                | Understand Avionics and communications - autopilot                      | Can explain system or component limitations                                                                                                                    |
| Avionics and Communications                                | Understand Avionics and communications - autopilot                      | Can explain all notes cautions or warnings listed in the OEM manuals & OEM manuals                                                                             |
| Avionics and Communications                                | Understand Avionics and communications - autopilot                      | Can explain immediate action items or memory items, if appropriate                                                                                             |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                      |                                                                                                                                                   |
|------------------------------------------------------------|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                         | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                              |
| Avionics and Communications                                | Understand Avionics and communications - autopilot                                   | Can use the appropriate checklists and NORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem or device    |
| Avionics and Communications                                | Understand Avionics and communications - autopilot                                   | Can use the appropriate checklists and ABNORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem, or device |
| Avionics and Communications                                | Understand Avionics and communications - Electronic Flight Instrument Systems (EFIS) | Can describe the operation of the airplane systems and components using correct terminology                                                       |
| Avionics and Communications                                | Understand Avionics and communications - Electronic Flight Instrument Systems (EFIS) | Can explain system or component limitations                                                                                                       |
| Avionics and Communications                                | Understand Avionics and communications - Electronic Flight Instrument Systems (EFIS) | Can explain all notes cautions or warnings listed in the OEM manuals & OEM manuals                                                                |
| Avionics and Communications                                | Understand Avionics and communications - Electronic Flight Instrument Systems (EFIS) | Can use the appropriate checklists and ABNORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem, or device |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS)              | Can describe the operation of the airplane systems and components using correct terminology                                                       |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS)              | Can explain system or component limitations                                                                                                       |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS)              | Can explain all notes cautions or warnings listed in the OEM manuals & OEM manuals                                                                |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                            |                                                                                                                                                   |
|------------------------------------------------------------|----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                               | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                              |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS)    | Can use the appropriate checklists and NORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem or device    |
| Avionics and Communications                                | Understand Avionics and communications - Flight Management System (FMS)    | Can use the appropriate checklists and ABNORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem, or device |
| Avionics and Communications                                | Understand Avionics and communications - Radar                             | Can describe the operation of the airplane systems and components using correct terminology                                                       |
| Avionics and Communications                                | Understand Avionics and communications - Radar                             | Can explain system or component limitations                                                                                                       |
| Avionics and Communications                                | Understand Avionics and communications - Radar                             | Can use the appropriate checklists and NORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem or device    |
| Avionics and Communications                                | Understand Avionics and communications - Inertial Navigation Systems (INS) | Can describe the operation of the airplane systems and components using correct terminology                                                       |
| Avionics and Communications                                | Understand Avionics and communications - Inertial Navigation Systems (INS) | Can explain system or component limitations                                                                                                       |
| Avionics and Communications                                | Understand Avionics and communications - Inertial Navigation Systems (INS) | Can explain all notes cautions or warnings listed in the OEM manuals & OEM manuals                                                                |
| Avionics and Communications                                | Understand Avionics and communications - Inertial Navigation Systems (INS) | Can use the appropriate checklists and NORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem or device    |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                         |                                                                                                                                                   |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

| COURSE 1                                            | TASKS                                                                                                                                                                                                                                      | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that an otherwise suitable RNAV system cannot be used for Lateral navigation on LOC-based courses (including LOC back-course guidance) without reference to raw LOC data                                                                                                                                                                                                                                                                                                 |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that The navigation data should be current for the duration of the flight. If the Aeronautical Information Regulation and Control (AIRAC) cycle will change during flight, operators and pilots should establish procedures to ensure the accuracy of navigation data, including suitability of navigation facilities used to define the routes and procedures for flight. Traditionally, this has been accomplished by verifying electronic data against paper products |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that Pilots must extract waypoints, NAVAIDs, and fixes by name from the onboard navigation database and comply with the charted procedure or route                                                                                                                                                                                                                                                                                                                       |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                                                                                                                                                                                      | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                    |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that pilots may not manually enter published procedure or route waypoints via latitude/longitude, place/bearing, or place/bearing/distance into the aircraft system                                                                                                                                                                                                                              |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that Pilots are expected to accurately track procedure and route centerlines (CL), as depicted by onboard lateral deviation indicators (LDI), displays, and/or flight guidance during all operations described in this AC unless otherwise authorized to deviate by air traffic control (ATC) or in the instance of an emergency condition                                                       |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that Operators operating under parts 91K, 121, 125, 129, and 135 must also be equipped with at least one other independent navigation system in addition to an installed and operable RNAV system. This additional system must be suitable, in the event of loss of navigation capability of the RNAV system, for proceeding safely to a suitable airport and completing an instrument approach. |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                                                                                                                                                                                      | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                          |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that ADF equipment need not be installed and operational, although operators of aircraft without an ADF will be bound by the operational requirements defined in AC 90-108 and not have access to some procedures (that is, there may be instances when some operations might not be conducted without ADF equipment). |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that for the purposes of flight planning, any required alternate airport must have an available IAP that does not require the use of GPS.                                                                                                                                                                              |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that RNAV systems using GPS input may be used as an alternate means of navigation without restriction.                                                                                                                                                                                                                 |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain RAIM prediction requirements when using GPS as a substitute means of navigation                                                                                                                                                                                                                                        |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                                                                                                                                                                            |                                                                                                                                                                                                                               |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                                                                                                                                                                                      | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                     |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that RNAV systems using WAAS input may be used as an alternate means of navigation without restriction.                                                                                                           |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that operators planning to use TSO-C145/-C146 equipment as a substitute means of navigation must check WAAS NOTAMs and confirm WAAS availability for the applicable operation and time                            |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that RNAV systems using DME/DME/IRU, without GPS input, may be used as an alternate means of navigation where valid DME/DME position updating is published as available (for example, by NOTAM or authorization). |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                                                                                                                                                                                      | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Avionics and Communications                         | Understand Avionics and communications - suitability and use of Area Navigation (RNAV) systems while operating on, or transitioning to, conventional, i.e., non-RNAV, routes and procedures within the U.S. National Airspace System (NAS) | Can explain that In order to use a substitute means of navigation on departure procedures, pilots of aircraft with RNAV systems using DME/DME/IRU, without GPS input, must ensure their aircraft navigation system position is confirmed, within 1,000 feet, at the start point of takeoff roll. The use of an automatic or manual runway update is an acceptable means of compliance with this requirement. A navigation map display may also be used to confirm aircraft position, if pilot procedures and display resolution allow for compliance with the 1,000-foot tolerance requirement. |
| Avionics and Communications                         | Understand Avionics and communications - ground-based navigation systems and components                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Avionics and Communications                         | Understand Avionics and communications - ground-based navigation systems and components | Can identify automatic or perform manual input requiring parameters, such as inbound course or automatic/manually tuned navigation frequencies, the importance of checking that proper selections have been made to ensure appropriate system performance, and the sequence and management of any mode changes.                                                                                                                                                                                                                                                                                                                        |
| Avionics and Communications                         | Understand Avionics and communications - ground-based navigation systems and components |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Avionics and Communications                         | Understand Avionics and Communications - Instruments                                    | Can interpret situation information displays, as applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Avionics and Communications                         | Understand Avionics and Communications - Supporting Systems                             | Can interpret Other associated instrumentation and displays including any head-up display, guidance system, vision system, monitoring displays, status displays, mode annunciation displays, failure or warning annunciations, and associated system status displays that may be relevant. When such airborne systems are used as the basis for category(s) of minima (e.g., HUD or SVGS for Special Authorization (SA) CAT I; AP, F/D, or HUD for CAT I Landing Minima with Reduced Lighting (RVR 1800)), training should address the relationships between the various system components and the minima for which they are required. |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                                                  | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Avionics and Communications                                | Understand Avionics and Communications - Instruments                                                          | Can describe proper application of controlling and/or advisory RVR, appropriate runway light settings, and proper determination of RVR values reported at foreign facilities.                                                                                                                                                                                                                                                                                                     |
| Avionics and Communications                                | Understand Avionics and Communications - Instruments                                                          | Can describe proper application of MDA, DA/DH, or AH, including proper use and setting of altimeter bugs, use of the inner marker (IM) where authorized or required due to irregular underlying terrain, and appropriate altimeter setting procedures for the barometric altimeter consistent with the operator's practice of using either altimeter setting referenced to airport ambient local pressure (QNH) or altimeter setting referenced to airport field elevation (QFE). |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems - TCAS Failure procedure | Can use the appropriate checklists and ABNORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem, or device                                                                                                                                                                                                                                                                                                                                 |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems                          | Can define TA (Traffic Advisory) as Aural voice and display information provided by TCAS to a flightcrew, identifying the location of nearby traffic that meets certain minimum separation criteria                                                                                                                                                                                                                                                                               |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems                          | Can describe TCAS on-ground performance                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                      |                                                                                                                           |
|------------------------------------------------------------|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                         | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                      |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that the see-and-avoid concept is still valid even with TCAS                                               |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can define Increase, reversal, crossing, and weakened Ras                                                                 |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that That TCAS II assures separation from aircraft equipped with an altitude-reporting transponder;        |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can explain the detection and protection provided by TCAS against altitude-reporting and non-altitude-reporting intruders |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that the system detects multiple aircraft                                                                  |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can explain TCAS to TCAS coordination                                                                                     |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate the potential impact of not following RAs                                                                  |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can differentiate between TCAS surveillance range versus display range                                                    |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can explain when an intruder will not be displayed                                                                        |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                      |                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------|--------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                                | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                   |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can explain the normal, expected pilot response to TAs, RAs, use of displayed traffic information to establish visual contact, and constraints on maneuvering based solely on Tas.                                                                                                                          |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems |                                                                                                                                                                                                                                                                                                             |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can state RA inhibit altitudes                                                                                                                                                                                                                                                                              |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can discuss the risks inherent to an inability to comply with an RA due to aircraft performance limitations after an engine failure, and appropriate response to RAs in limiting performance conditions, such as during heavy weight takeoff or while en route at maximum altitude for a particular weight. |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can explain communication and coordination with ATC related to or following a TCAS event, when to contact ATC, and accepted TCAS phraseology.                                                                                                                                                               |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can identify TCAS symbology                                                                                                                                                                                                                                                                                 |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can explain radar altimeter inputs to TCAS, and weather radar/electronic flight information system (EFIS) interfaces                                                                                                                                                                                        |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                      |                                                                                                                                                                                                               |
|-----------------------------------------------------|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                                | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                     |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can demonstrate familiarization with AFM provisions including information on TCAS modes of operation; normal and atypical flightcrew operating procedures; and response to TAs, RAs, and any AFM limitations. |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can demonstrate familiarization with MEL procedures related to TCAS                                                                                                                                           |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can describe appropriate pilot response to TCAS RAs and TAs, ATC clearance compliances and nuisance alerts.                                                                                                   |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can state that TCAS interrogates other transponder-equipped aircraft within a nominal range of 14 nautical miles (NM).                                                                                        |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that TCAS surveillance range can be reduced in geographic areas with a large number of ground interrogators and/or TCAS II equipped aircraft                                                   |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can state that TAs can be issued against any transponder-equipped aircraft which responds to the ICAO Mode C interrogations, even if the aircraft does not have altitude reporting capability.                |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can state that RAs can be issued only against aircraft that are reporting altitude and only in the vertical plane                                                                                             |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                      |                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------|--------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                                | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                            |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can state that RAs issued against a TCAS-equipped intruder are coordinated to ensure the issuance of complementary RAs                                                                                                                                                                                                                               |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can explain that TCAS advisories are based on time to CPA rather than distance. The time must be short and vertical separation must be small, or projected to be small, before an advisory can be issued. The separation standards provided by Air Traffic Services (ATS) are different from the missed distances against which TCAS issues an alert |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can explain that the time must be short and vertical separation must be small, or projected to be small, before an advisory can be issued.                                                                                                                                                                                                           |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that the separation standards provided by Air Traffic Services (ATS) are different from the missed distances against which TCAS issues an alert                                                                                                                                                                                       |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that the thresholds for issuing a TA or RA vary with altitude, and are larger at higher altitudes.                                                                                                                                                                                                                                    |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that TA threshold (trigger point) varies from 20 to 48 seconds before the projected CPA and the RA tau threshold varies from 15 to 35 seconds                                                                                                                                                                                         |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                      |                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------|--------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                         | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                                                                                                                                                                             |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can explain that RAs are chosen to provide the desired vertical missed distance at CPA. As a result, RAs can instruct a climb or descent through the intruder aircraft's altitude.                                                                                                                                               |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that TCAS will neither track nor display non-transponder-equipped aircraft, nor aircraft not responding to TCAS Mode C interrogations.                                                                                                                                                                            |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can explain that TCAS will automatically fail if the input from the aircraft's barometric altimeter, radio altimeter, or transponder is lost                                                                                                                                                                                     |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that TCAS may not display all proximate transponder-equipped aircraft in areas of high-density traffic.                                                                                                                                                                                                           |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that, Because of design limitations, the bearing displayed by TCAS is not sufficiently accurate to support the initiation of horizontal maneuvers based solely on the traffic display                                                                                                                             |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that Because of design limitations, TCAS will not track intruders with a Vertical Speed (VS) in excess of 10,000 feet per minute (fpm). In addition, the design implementation may result in some short-term errors in the tracked VS of an intruder during periods of high vertical acceleration by the intruder |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                      |                                                                                                                                                                                                                                 |
|-----------------------------------------------------|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                                | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                       |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that Ground proximity warning system (GPWS) warnings and windshear warnings take precedence over TCAS advisories. When either a GPWS or windshear warning is active, TCAS aural annunciations will be inhibited. |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that “INCREASE DESCENT” RAs are inhibited below 1,450 (±100) feet AGL                                                                                                                                            |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that “DESCEND” RAs are inhibited below 1,100 (±100) feet AGL.                                                                                                                                                    |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that all RAs are inhibited below 1,000 (±100) feet AGL.                                                                                                                                                          |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that all TCAS aural annunciations are inhibited below 500 (±100) feet AGL.                                                                                                                                       |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that . If your aircraft type provides RA climb and increase climb commands at certified ceiling, the commands are to be followed.                                                                                |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                      |                                                                                                                                                                                                                                                               |
|------------------------------------------------------------|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                         | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                                                                                                          |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can demonstrate the proper use of controls including appreciate that low display ranges are used in the terminal area and the higher display ranges are used in the en route environment and in the transition between the terminal and en route environment. |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can demonstrate the proper use of controls including appreciate that if available, recommended usage of the “ABOVE/BELOW” mode selector. “ABOVE” mode should be used during climb and the “BELOW” mode should be used during descent.                         |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can demonstrate the proper use of controls including appreciate that the configuration of the display does not affect the TCAS surveillance volume.                                                                                                           |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can demonstrate the proper use of controls including appreciate the benefits of selecting lower ranges when an advisory is issued, in order to increase display resolution                                                                                    |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can demonstrate the proper use of controls including differentiate between the display of absolute altitude and relative altitude and explain the limitations of using this display if a barometric correction is not provided to TCAS.                       |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                      |                                                                                                                                                                  |
|------------------------------------------------------------|--------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                         | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                             |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can execute proper configuration to display the appropriate TCAS information without eliminating the display of other needed information.                        |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can recognize traffic within the selected display range that is not proximate traffic, (not causing a TA or RA to be issued).                                    |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can recognize proximate traffic in the display, i.e., traffic that is within 6 NM and $\pm 1200$ feet.                                                           |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can recognize non-altitude reporting traffic in the display.                                                                                                     |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can recognize no bearing TAs and RAs                                                                                                                             |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can determine when it is necessary to change the selected range for off-scale TAs and RAs to ensure that all available information on the intruder is displayed. |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can describe how to select the minimum available display range which allows the display of TAs to provide the maximum display resolution                         |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can describe how to select the minimum available display range which allows the display of TAs to provide the maximum display resolution                         |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                      |                                                                                                                                                                                                                            |
|------------------------------------------------------------|--------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                         | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                                                                       |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that navigation displays oriented on track-up may require a pilot to make a mental adjustment for drift angle when assessing the bearing of proximate traffic.                                              |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can explain the meaning of the red and green areas displayed on the RA display and when the green areas will and will not be displayed.                                                                                    |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can demonstrate general familiarization with the operator's guidance for the use of "TA-ONLY."                                                                                                                             |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that if "TA-ONLY" is not selected when an airport is conducting simultaneous operations from parallel runways separated by less than 1,200 feet, and to some intersecting runways, RAs can be expected      |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that in TA mode, the TA aural annunciation is inhibited below 500 feet AGL. As a result, TAs issued below 500 feet AGL may not be noticed unless the TA display is included in the routine instrument scan. |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can appreciate that in TA-ONLY mode, TAs will be issued at the time an RA is normally issued.                                                                                                                              |
| Avionics and Communications                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems | Can describe the division of duties between Pilot Flying (PF) and pilot monitoring (PM)                                                                                                                                    |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                                                                                           |                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                                                                                                     | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                         |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems                                                                      | Can state the expected callouts during a TA or RA                                                                                                                                                                                                                                 |
| Avionics and Communications                         | Understand Avionics and communications - traffic awareness/warning/avoidance systems                                                                      | Can describe proper communications with ATC during a TA or RA                                                                                                                                                                                                                     |

| Flight Controls                                            | Understand Flight Controls - leading edge devices                             |                                                                                          |
| Flight Controls                                            | Understand Flight Controls - speed brakes                                     |                                                                                          |
| Flight Controls                                            | Understand Flight Controls - speed brakes                                     |                                                                                          |
| Flight Controls                                            | Understand Flight Controls - speed brakes                                     |                                                                                          |
| Flight Controls                                            | Understand Flight Controls - speed brakes                                     |                                                                                          |
| Flight Controls                                            | Understand Flight Controls - stability augmentation system (e.g., yaw damper) |                                                                                          |
| Flight Controls                                            | Understand Flight Controls - stability augmentation system (e.g., yaw damper) |                                                                                          |
| Flight Controls                                            | Understand Flight Controls - stability augmentation system (e.g., yaw damper) |                                                                                          |
| Flight Controls                                            | Understand Flight Controls - stability augmentation system (e.g., yaw damper) |                                                                                          |
| Flight Controls                                            | Understand Flight Controls - trim systems                                     |                                                                                          |
| Flight Controls                                            | Understand Flight Controls - trim systems                                     |                                                                                          |
| Flight Controls                                            | Understand Flight Controls - trim systems                                     |                                                                                          |
| Flight Controls                                            | Understand Flight Controls - trim systems                                     |                                                                                          |
| Flight Planning and Performance                            | Understand determining climb performance per AFM                              | Can explain why OEI data may not ensure climb gradient compliance nor obstacle clearance |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                    |                                                                                                                                                                                                                                                    |
|-----------------------------------------------------|------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                              | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                          |
| Flight Planning and Performance                     | Understand ground operations in icing conditions                                   | Can explain the general adverse effects of ice, snow and frost on aircraft performance and flight characteristics: decreased thrust, decreased lift, increased stall speed, trim changes, and altered stall characteristics and handling qualities |
| Flight Planning and Performance                     | Understand determining climb performance per AFM                                   | Can explain considerations for OEI departure development                                                                                                                                                                                           |
| Flight Planning and Performance                     | Understand determining climb performance per AFM                                   | Can state the definition of takeoff segment                                                                                                                                                                                                        |
| Flight Planning and Performance                     | Understand determining climb performance per AFM                                   | Can state the definitions of gross and net flightpath                                                                                                                                                                                              |
| Flight Planning and Performance                     | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that there are two types of DPs: Standard Instrument Departures (SIDs) and Obstacle Departure Procedures (ODPs)                                                                                                                        |
| Flight Planning and Performance                     | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that SIDs are primarily designed for air traffic system enhancement to expedite traffic flow and to reduce pilot/controller workload.                                                                                                  |
| Flight Planning and Performance                     | Understand Avionics and communications - Global Navigation Satellite System (GNSS) | Can explain that ODPs are recommended for obstruction clearance and may be flown without ATC clearance unless an alternate DP (SID or radar vector) has been specifically assigned by ATC.                                                         |
| Flight Planning and Performance                     | Understand determining landing performance per AFM                                 | Can explain the risks associated with tailwind landings and landings on contaminated runways                                                                                                                                                       |
| Flight Planning and Performance                     | Understand Mitigating Risks of a Runway Overrun Upon Landing                       | Can explain how an unstabilized approach can contribute to a runway overrun                                                                                                                                                                        |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                              |                                                                                                                                                     |
|------------------------------------------------------------|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                 | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                |
| Flight Planning and Performance                            | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can explain how high airport elevation can contribute to a runway overrun                                                                           |
| Flight Planning and Performance                            | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can explain how excess airspeed can contribute to a runway overrun                                                                                  |
| Flight Planning and Performance                            | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can explain how airplane landing weight can contribute to an aircraft overrun                                                                       |
| Flight Planning and Performance                            | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can explain how landing beyond the intended touchdown point can contribute to a runway overrun                                                      |
| Flight Planning and Performance                            | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can explain how downhill runway slope can contribute to a runway overrun                                                                            |
| Flight Planning and Performance                            | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can explain how landing with a tailwind can contribute to a runway overrun                                                                          |
| Flight Planning and Performance                            | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can explain predeparture planning versus runway condition at time of arrival                                                                        |
| Flight Planning and Performance                            | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can explain that factors affecting landing distance are cumulative, and why multiple small errors during landing can contribute to a runway overrun |
| Flight Planning and Performance                            | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can define declared runway distance                                                                                                                 |
| Flight Planning and Performance                            | Understand determining landing performance per AFM           | Can explain the origin and use of runway Declared Distances                                                                                         |
| Flight Planning and Performance                            | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can define landing distance available                                                                                                               |
| Flight Planning and Performance                            | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can define actual landing distance                                                                                                                  |
| Flight Planning and Performance                            | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can interpret and make proper runway condition reports                                                                                              |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                                                |                                                                                                          |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                                                          | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                |
| Flight Planning and Performance                     | Understand Runway assessment and condition reporting and use of the Runway Condition Assessment Matrix (RCAM). | Can explain and demonstrate the use of charts, tables, and data to determine performance                 |
| Flight Planning and Performance                     | Understand Mitigating Risks of a Runway Overrun Upon Landing                                                   | Can define "adjusted landing distance"                                                                   |
| Flight Planning and Performance                     | Understand Mitigating Risks of a Runway Overrun Upon Landing                                                   | Can define "unfactored (certified) landing distance"                                                     |
| Flight Planning and Performance                     | Understand Mitigating Risks of a Runway Overrun Upon Landing                                                   | Can define "factored landing distance"                                                                   |
| Flight Planning and Performance                     | Understand Mitigating Risks of a Runway Overrun Upon Landing                                                   | Can describe the effect of downhill runway slope on required landing distance                            |
| Flight Planning and Performance                     | Understand Mitigating Risks of a Runway Overrun Upon Landing                                                   | Can describe the impact of excess airspeed on landing distance                                           |
| Flight Planning and Performance                     | Understand Mitigating Risks of a Runway Overrun Upon Landing                                                   | Can explain the purpose and variables involved in a landing performance assessment at time of arrival    |
| Flight Planning and Performance                     | Understand Mitigating Risks of a Runway Overrun Upon Landing                                                   | Can explain the effect of wind on landing performance                                                    |
| Flight Planning and Performance                     | Understand Mitigating Risks of a Runway Overrun Upon Landing                                                   | Can identify critical condition combinations that increase risk of a runway overrun                      |
| Flight Planning and Performance                     | Understand Mitigating Risks of a Runway Overrun Upon Landing                                                   | Can explain the difference between AFM dry, certified/approved data and advisory/supplemental data       |
| Flight Planning and Performance                     | Understand Mitigating Risks of a Runway Overrun Upon Landing                                                   | Can calculate the required effective landing distance for dispatch under part 91 and part 135 operations |
| Flight Planning and Performance                     | Understand Mitigating Risks of a Runway Overrun Upon Landing                                                   | Can reference applicable regulations for preflight planning                                              |
| Flight Planning and Performance                     | Understand Mitigating Risks of a Runway Overrun Upon Landing                                                   | Can explain the Can U StoP process                                                                       |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                                                |                                                                                                                                                                                   |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                                                   | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                              |
| Flight Planning and Performance                            | Understand Mitigating Risks of a Runway Overrun Upon Landing                                                   | Can explain the difference between the generic samples in table 3-2 where cumulative errors are made, and table 3-3 where errors are not made                                     |
| Flight Planning and Performance                            | Understand Runway assessment and condition reporting and use of the Runway Condition Assessment Matrix (RCAM). |                                                                                                                                                                                   |
| Flight Planning and Performance                            | Understand determining accelerate-stop / accelerate-go distance per AFM                                        | Can explain and demonstrate the use of charts, tables, and data to determine performance                                                                                          |
| Flight Planning and Performance                            | Understand determining accelerate-stop / accelerate-go distance per AFM                                        | Can demonstrate proficient use of appropriate performance charts, tables, graphs, or other data to determine airplane performance and limitations for all phases of flight        |
| Flight Planning and Performance                            | Understand determining accelerate-stop / accelerate-go distance per AFM                                        | Can describe the effects of meteorological conditions on performance for any phase of flight and apply these factors to a specific chart, table, graph, or other performance data |
| Flight Planning and Performance                            | Understand determining takeoff performance (e.g., balance field length, VMCG) per AFM                          | Can explain and demonstrate the use of charts, tables, and data to determine performance                                                                                          |
| Flight Planning and Performance                            | Understand determining takeoff performance (e.g., balance field length, VMCG) per AFM                          | Can demonstrate proficient use of appropriate performance charts, tables, graphs, or other data to determine airplane performance and limitations for all phases of flight        |
| Flight Planning and Performance                            | Understand determining takeoff performance (e.g., balance field length, VMCG) per AFM                          | Can explain the airspeeds used during specific phases of flight                                                                                                                   |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                                   |                                                                                                                                                                                   |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                                      | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                              |
| Flight Planning and Performance                            | Understand determining takeoff performance (e.g., balance field length, VMCG) per AFM             | Can describe the effects of meteorological conditions on performance for any phase of flight and apply these factors to a specific chart, table, graph, or other performance data |
| Flight Planning and Performance                            | Understand determining climb performance per AFM                                                  | Can explain and demonstrate the use of charts, tables, and data to determine performance                                                                                          |
| Flight Planning and Performance                            | Understand determining climb performance per AFM                                                  | Can demonstrate proficient use of appropriate performance charts, tables, graphs, or other data to determine airplane performance and limitations for all phases of flight        |
| Flight Planning and Performance                            | Understand determining climb performance per AFM                                                  | Can describe the effects of meteorological conditions on performance for any phase of flight and apply these factors to a specific chart, table, graph, or other performance data |
| Flight Planning and Performance                            | Understand determining cruise performance (e.g., optimum and maximum operating altitudes) per AFM | Can explain and demonstrate the use of charts, tables, and data to determine performance                                                                                          |
| Flight Planning and Performance                            | Understand determining cruise performance (e.g., optimum and maximum operating altitudes) per AFM | Can demonstrate proficient use of appropriate performance charts, tables, graphs, or other data to determine airplane performance and limitations for all phases of flight        |
| Flight Planning and Performance                            | Understand determining cruise performance (e.g., optimum and maximum operating altitudes) per AFM | Can describe the effects of meteorological conditions on performance for any phase of flight and apply these factors to a specific chart, table, graph, or other performance data |

| Flight Planning and Performance                     | Understand determining performance with an inoperative powerplant for all phases of flight per AFM             | Can demonstrate proficient use of appropriate performance charts, tables, graphs, or other data to determine airplane performance and limitations for all phases of flight        |
| Flight Planning and Performance                     | Understand determining performance with an inoperative powerplant for all phases of flight per AFM             | Can describe the effects of meteorological conditions on performance for any phase of flight and apply these factors to a specific chart, table, graph, or other performance data |
| Flight Planning and Performance                     | Understand determining fuel requirements per AFM                                                               | Can explain and demonstrate the use of charts, tables, and data to determine performance                                                                                          |
| Flight Planning and Performance                     | Understand determining fuel requirements per AFM                                                               | Can demonstrate proficient use of appropriate performance charts, tables, graphs, or other data to determine airplane performance and limitations for all phases of flight        |
| Flight Planning and Performance                     | Understand determining fuel requirements per AFM                                                               | Can describe the effects of meteorological conditions on performance for any phase of flight and apply these factors to a specific chart, table, graph, or other performance data |
| Flight Planning and Performance                     | Understand Runway assessment and condition reporting and use of the Runway Condition Assessment Matrix (RCAM). | Can explain and demonstrate the use of charts, tables, and data to determine performance                                                                                          |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM                                        |                                                                                                                                                                                   |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM                                        |                                                                                                                                                                                   |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                                   |                                           |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------|-------------------------------------------|
| COURSE 1                                            | TASKS                                                                                             | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM                           |                                           |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM                           |                                           |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM                           |                                           |
| Flight Planning and Performance                     | Understand determining takeoff performance (e.g., balance field length, VMCG) per AFM             |                                           |
| Flight Planning and Performance                     | Understand determining takeoff performance (e.g., balance field length, VMCG) per AFM             |                                           |
| Flight Planning and Performance                     | Understand determining takeoff performance (e.g., balance field length, VMCG) per AFM             |                                           |
| Flight Planning and Performance                     | Understand determining takeoff performance (e.g., balance field length, VMCG) per AFM             |                                           |
| Flight Planning and Performance                     | Understand determining takeoff performance (e.g., balance field length, VMCG) per AFM             |                                           |
| Flight Planning and Performance                     | Understand determining climb performance per AFM                                                  |                                           |
| Flight Planning and Performance                     | Understand determining climb performance per AFM                                                  |                                           |
| Flight Planning and Performance                     | Understand determining climb performance per AFM                                                  |                                           |
| Flight Planning and Performance                     | Understand determining climb performance per AFM                                                  |                                           |
| Flight Planning and Performance                     | Understand determining cruise performance (e.g., optimum and maximum operating altitudes) per AFM |                                           |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                                   |                                           |
|-----------------------------------------------------|---------------------------------------------------------------------------------------------------|-------------------------------------------|

| Flight Planning and Performance                     | Understand determining cruise performance (e.g., optimum and maximum operating altitudes) per AFM |                                           |
| Flight Planning and Performance                     | Understand determining cruise performance (e.g., optimum and maximum operating altitudes) per AFM |                                           |
| Flight Planning and Performance                     | Understand determining cruise performance (e.g., optimum and maximum operating altitudes) per AFM |                                           |
| Flight Planning and Performance                     | Understand determining cruise performance (e.g., optimum and maximum operating altitudes) per AFM |                                           |
| Flight Planning and Performance                     | Understand determining descent performance per AFM                                                |                                           |
| Flight Planning and Performance                     | Understand determining descent performance per AFM                                                |                                           |
| Flight Planning and Performance                     | Understand determining descent performance per AFM                                                |                                           |
| Flight Planning and Performance                     | Understand determining descent performance per AFM                                                |                                           |
| Flight Planning and Performance                     | Understand determining descent performance per AFM                                                |                                           |
| Flight Planning and Performance                     | Understand determining landing performance per AFM                                                |                                           |
| Flight Planning and Performance                     | Understand determining landing performance per AFM                                                |                                           |
| Flight Planning and Performance                     | Understand determining landing performance per AFM                                                |                                           |
| Flight Planning and Performance                     | Understand determining landing performance per AFM                                                |                                           |
| Flight Planning and Performance                     | Understand determining landing performance per AFM                                                |                                           |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                                                |                                           |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| COURSE 1                                            | TASKS                                                                                                          | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES |
| Flight Planning and Performance                     | Understand determining performance with an inoperative powerplant for all phases of flight per AFM             |                                           |
| Flight Planning and Performance                     | Understand determining performance with an inoperative powerplant for all phases of flight per AFM             |                                           |
| Flight Planning and Performance                     | Understand determining performance with an inoperative powerplant for all phases of flight per AFM             |                                           |
| Flight Planning and Performance                     | Understand determining performance with an inoperative powerplant for all phases of flight per AFM             |                                           |
| Flight Planning and Performance                     | Understand determining performance with an inoperative powerplant for all phases of flight per AFM             |                                           |
| Flight Planning and Performance                     | Understand determining fuel requirements per AFM                                                               |                                           |
| Flight Planning and Performance                     | Understand determining fuel requirements per AFM                                                               |                                           |
| Flight Planning and Performance                     | Understand determining weight and balance per AFM                                                              |                                           |
| Flight Planning and Performance                     | Understand determining weight and balance per AFM                                                              |                                           |
| Flight Planning and Performance                     | Understand Runway assessment and condition reporting and use of the Runway Condition Assessment Matrix (RCAM). |                                           |
| Flight Planning and Performance                     | Conduct Rejected Takeoff                                                                                       |                                           |
| Flight Planning and Performance                     | Conduct Rejected Takeoff                                                                                       |                                           |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                         |                                                                                                      |
|-----------------------------------------------------|-------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                   | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                            |
| Flight Planning and Performance                     | Conduct Rejected Takeoff                                                |                                                                                                      |
| Flight Planning and Performance                     | Conduct Rejected Takeoff                                                |                                                                                                      |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can define Takeoff Distance                                                                          |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can define Takeoff Run                                                                               |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM |                                                                                                      |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can define Accelerate-Stop Distance                                                                  |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can define Decision Speed                                                                            |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can define V <sub>1</sub> as Action Speed                                                            |
| Flight Planning and Performance                     | Understand determining climb performance per AFM                        | Can explain why using OEI data to comply with TERPS procedures is an unnecessary burden on operators |
| Flight Planning and Performance                     | Understand determining climb performance per AFM                        | Can locate FAA TALPA videos online                                                                   |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can state the different causes of RTOs                                                               |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can explain the difference between Takeoff Distance and Takeoff Run                                  |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can define V <sub>1</sub> and determine when V <sub>1</sub> is critical                              |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                         |                                                                                   |
|-----------------------------------------------------|-------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                   | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                         |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can explain the Balanced Field Concept                                            |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can explain why $V_1$ can be no less than $V_{MCG}$ nor can be no more than $V_R$ |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can explain when takeoff field length and $V_1$ are critical and the consequences |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can explain the impact of wet runways on landing distances                        |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can explain the importance of a timely $V_1$ call.                                |
| Flight Planning and Performance                     | Understand determining accelerate-stop / accelerate-go distance per AFM | Can conduct a complete takeoff briefing and explain its importance                |
| Flight Planning and Performance                     | Understand determining climb performance per AFM                        | Can describe the segments of an instrument departure procedure                    |
| Flight Planning and Performance                     | Understand determining climb performance per AFM                        | Can explain basic purpose and applicability of OEI departure procedures           |
| Flight Planning and Performance                     | Understand determining climb performance per AFM                        | Can describe the drawbacks of using OEI data to comply with TERPS procedures      |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                            | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Flight Planning and Performance                     | Understand determining climb performance per AFM | Can demonstrate familiarization with aircraft performance or weight limit information to ensure safe obstacle clearance for “all engine” or “engine inoperative” missed approaches or rejected landings. Performance information should consider, as appropriate, flap settings, go-around procedures, acceleration segments or transition following an engine failure between the specified “all-engine lateral flightpath” (or radar vectors) and any specified “engine-inoperative lateral flightpath,” using flap retraction, and cleanup height procedures. Refer to AC 120-91 for further information. |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach                    | Can explain that unstabilized approaches are a key contributor to CFIT events, and explain that present NPAs are designed with and without stepdown fixes in the final approach                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach                    | Can explain why stepdowns flown without a constant descent will require multiple thrust, pitch, and altitude adjustments inside the final approach fix (FAF), and can explain that these adjustments increase pilot workload and potential errors during a critical phase of flight.                                                                                                                                                                                                                                                                                                                         |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                               |                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                         | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                               |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach | Can explain that the practice commonly referred to as “dive and drive,” can result in extended level flight as low as 250 feet above the ground in instrument meteorological conditions (IMC) and shallow or steep final approaches.                                    |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach | Can explain that a stabilized approach is a key feature to a safe approach and landing.<br>Can explain that operators are encouraged by the FAA and the International Civil Aviation Organization (ICAO) to use the stabilized approach concept to help eliminate CFIT. |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach | Can explain that the stabilized approach concept is characterized by maintaining a stable approach speed, descent rate, vertical flightpath, and configuration to the landing touchdown point                                                                           |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach | Can explain that precision IAPs and approach procedures with vertical guidance (APV) have a continuous descent approach profile in their design.                                                                                                                        |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach | Can explain that NPAs were not originally designed with this vertical path, but may easily be flown using the CDFA (continuous descent final approach) technique.                                                                                                       |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach | Can explain why Flying NPAs with a continuous descent profile will provide a safety advantage over flying approaches using the “dive and drive” technique.                                                                                                              |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                         | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach | Can explain that CDFA is a technique for flying the final approach segment of an NPA as a continuous descent. The technique is consistent with stabilized approach procedures and has no level-off.                                                                                                                                                                                                                                                                                                                                                         |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach | Can explain the six advantages of CDFA: Increased safety by employing the concepts of stabilized approach criteria and procedure standardization; Improved pilot situational awareness (SA) and reduced pilot workload; Improved fuel efficiency by minimizing the low-altitude level flight time; Reduced noise level by minimizing the level flight time at high thrust settings; Procedural similarities to APV and precision approach operations; Reduced probability of infringement on required obstacle clearance during the final approach segment. |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach | Can explain that CDFA requires no specific aircraft equipment other than that specified by the title of the NPA procedure and that Pilots can safely fly suitable NPAs with CDFA using basic piloting techniques, aircraft flight management systems (FMS) and RNAV systems, or by manually computing rate of descent.                                                                                                                                                                                                                                      |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach | Can calculate a rate of descent for VDA (see example in this paragraph)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                         | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                                         |
| Flight Profiles and Maneuvers                       | Conduct Missed Approach       | Can explain that when executing a missed approach prior to the MAP and not cleared by an air traffic control (ATC) climb-out instruction, pilots should fly the published missed approach procedure by proceeding on published track to the MAP before accomplishing a turn, complying with published altitude restrictions between the FAF and the MAP, and continuing on or climbing to the altitude specified in the missed approach procedure |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach | Can explain that some approach characteristics (e.g., circling-only minima) and environmental factors (e.g., icing) could make the use of CDFA inadvisable.                                                                                                                                                                                                                                                                                       |
| Flight Profiles and Maneuvers                       | Conduct Taxi                  | Can explain the definition of a runway incursion: Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle, or person on the protected area of a surface designated for the landing and takeoff of aircraft.                                                                                                                                                                                                       |
| Flight Profiles and Maneuvers                       | Conduct Taxi                  | Can explain why thorough planning for taxi operations is essential for a safe operation                                                                                                                                                                                                                                                                                                                                                           |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |              |                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS        | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                           |
| Flight Profiles and Maneuvers                       | Conduct Taxi | Can conduct briefing of the expected taxi route to include any hold short lines and runways to cross, hot spots, and any other potential conflicts. (Once taxi instructions are received, the pretaxi route should be reviewed and monitored. It is essential that any changes to the taxi route be understood by all crewmembers)  |
| Flight Profiles and Maneuvers                       | Conduct Taxi | Can identify critical locations on the taxi route, where verbal coordination between the PIC and the SIC is important to avoid a runway incursion. (e.g., hot spots/complex intersections, crossing intervening runways, entering and lining up on the runway for takeoff, and approaching and lining up on the runway for landing) |
| Flight Profiles and Maneuvers                       | Conduct Taxi | Can conduct briefing of requirements and special considerations during low visibility operations such as: the low visibility taxi chart, if published for the airport                                                                                                                                                               |
| Flight Profiles and Maneuvers                       | Conduct Taxi | Can maintain knowledge of the aircraft's precise position throughout the taxi operation and mentally calculate the next location on the route that will require increased attention (e.g., a turn onto another taxiway, an intersecting runway, or hot spots)                                                                       |
| Flight Profiles and Maneuvers                       | Conduct Taxi | Can interpret and use all visual aids, and signage and lighting on the airport surface                                                                                                                                                                                                                                              |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                              |                                                                                                                                                                                                                                                       |
|-----------------------------------------------------|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                        | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                             |
| Flight Profiles and Maneuvers                       | Conduct Taxi                                                 | Can write down complex taxi instructions or copy taxi instructions into the scratch pad of the CDU                                                                                                                                                    |
| Flight Profiles and Maneuvers                       | Conduct Taxi                                                 | Can explain that before entering a runway for takeoff, the flightcrew should verbally coordinate to ensure correct flap setting, identification of the runway, compass heading, FMC entry, and receipt of the proper ATC clearance to use that runway |
| Flight Profiles and Maneuvers                       | Understand determining landing performance per AFM           | Can identify and manage risks associated with runway overruns during the landing                                                                                                                                                                      |
| Flight Profiles and Maneuvers                       | Understand determining landing performance per AFM           | Can explain the parameters and importance of a stabilized approach                                                                                                                                                                                    |
| Flight Profiles and Maneuvers                       | Understand determining landing performance per AFM           | Can explain the importance of accurate and timely assessments of landing distance                                                                                                                                                                     |
| Flight Profiles and Maneuvers                       | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can explain how excessive height over the runway threshold can contribute to a runway overrun                                                                                                                                                         |
| Flight Profiles and Maneuvers                       | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can explain how delayed use of deceleration/maximum braking can contribute to a runway overrun                                                                                                                                                        |
| Flight Profiles and Maneuvers                       | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can describe the point at which landing configuration should be established in a stabilized approach                                                                                                                                                  |
| Flight Profiles and Maneuvers                       | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can describe a stabilized approach profile for both VMC and IMC conditions                                                                                                                                                                            |
| Flight Profiles and Maneuvers                       | Understand Mitigating Risks of a Runway Overrun Upon Landing | Can describe the characteristics of a stabilized descent rate                                                                                                                                                                                         |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                                    |                                                                                                                                                                                                                 |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                                              | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                       |
| Flight Profiles and Maneuvers                       | Understand Mitigating Risks of a Runway Overrun Upon Landing                                       | Can describe the characteristics of indicated airspeed during a stabilized approach                                                                                                                             |
| Flight Profiles and Maneuvers                       | Understand Mitigating Risks of a Runway Overrun Upon Landing                                       | Can explain that ATP criteria for touchdown point is the aiming point markings - 250/+500 feet, or where there are no runway aiming point markings 750 to 1,500 feet from the approach threshold of the runway. |
| Flight Profiles and Maneuvers                       | Understand Mitigating Risks of a Runway Overrun Upon Landing                                       | Can explain proper landing and braking technique                                                                                                                                                                |
| Flight Profiles and Maneuvers                       | Understand Mitigating Risks of a Runway Overrun Upon Landing                                       | Can discuss the chain of events that lead to an overrun in this example, and relate it to their own experiences                                                                                                 |
| Flight Profiles and Maneuvers                       | Understand determining accelerate-stop / accelerate-go distance per AFM                            | Can explain the airspeeds used during specific phases of flight                                                                                                                                                 |
| Flight Profiles and Maneuvers                       | Understand determining climb performance per AFM                                                   | Can explain the airspeeds used during specific phases of flight                                                                                                                                                 |
| Flight Profiles and Maneuvers                       | Understand determining cruise performance (e.g., optimum and maximum operating altitudes) per AFM  | Can explain the airspeeds used during specific phases of flight                                                                                                                                                 |
| Flight Profiles and Maneuvers                       | Understand determining descent performance per AFM                                                 | Can explain the airspeeds used during specific phases of flight                                                                                                                                                 |
| Flight Profiles and Maneuvers                       | Understand determining landing performance per AFM                                                 | Can explain the airspeeds used during specific phases of flight                                                                                                                                                 |
| Flight Profiles and Maneuvers                       | Understand determining performance with an inoperative powerplant for all phases of flight per AFM | Can explain the airspeeds used during specific phases of flight                                                                                                                                                 |
| Flight Profiles and Maneuvers                       | Conduct Taxi                                                                                       | Can explain the information available on an airport diagram, chart supplement and NOTAMS                                                                                                                        |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                            |                                                                                                                                                                 |
|-----------------------------------------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                      | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                       |
| Flight Profiles and Maneuvers                       | Conduct Taxi                               | Can interpret taxi instructions including published taxi routes                                                                                                 |
| Flight Profiles and Maneuvers                       | Conduct Taxi                               | Can identify airport and runway markings, signs, and lights                                                                                                     |
| Flight Profiles and Maneuvers                       | Conduct Taxi                               | Can describe appropriate aircraft lighting for day and night operations                                                                                         |
| Flight Profiles and Maneuvers                       | Conduct Taxi                               | Can describe appropriate flight deck activities prior to taxi, including route planning, identifying the location of Hot Spots, and coordinating with crew      |
| Flight Profiles and Maneuvers                       | Conduct Taxi                               | Can describe proper procedures for entering or crossing runways                                                                                                 |
| Flight Profiles and Maneuvers                       | Conduct Taxi                               | Can explain procedures for taxi on one engine                                                                                                                   |
| Flight Profiles and Maneuvers                       | Conduct Taxi                               | Can explain the hazards of low visibility taxi operations                                                                                                       |
| Flight Profiles and Maneuvers                       | Conduct Rejected Takeoff                   | Can describe conditions and situations that could warrant a rejected takeoff (e.g., takeoff warning systems, powerplant failure, other systems warning/failure) |
| Flight Profiles and Maneuvers                       | Conduct Rejected Takeoff                   | Can describe safety considerations following a rejected takeoff                                                                                                 |
| Flight Profiles and Maneuvers                       | Conduct Rejected Takeoff                   | Can explain the procedure for accomplishing a rejected takeoff                                                                                                  |
| Flight Profiles and Maneuvers                       | Conduct Rejected Takeoff                   | Can explain accelerate/stop distance                                                                                                                            |
| Flight Profiles and Maneuvers                       | Conduct Rejected Takeoff                   | Can define relevant V-speeds for a rejected takeoff                                                                                                             |
| Flight Profiles and Maneuvers                       | Understand Specific Flight Characteristics | Can explain all specific flight and performance characteristics associated with the aircraft                                                                    |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                         |                                                                                                                                                                                                    |
|-----------------------------------------------------|-------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                   | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                          |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach                                           | Can explain procedures and limitations associated with a nonprecision approach, including the differences between Localizer Performance (LP) and Lateral Navigation (LNAV) approach guidance       |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach                                           | Can explain navigation system displays and annunciations, modes of operation, and RNP lateral accuracy values associated with an RNAV (GPS) approach.                                              |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach                                           | Can explain ground-based and satellite-based navigation (orientation, course determination, equipment, tests and regulations, interference, appropriate use of navigation data, signal integrity). |
| Flight Profiles and Maneuvers                       | Conduct Nonprecision Approach                                           | Can explain criteria for a stabilized approach, to include energy management concepts.                                                                                                             |
| Flight Profiles and Maneuvers                       | Conduct Emergency Procedure - Emergency Descent                         | Can explain situations that would require an emergency descent (e.g., depressurization, smoke, or engine fire).                                                                                    |
| Flight Profiles and Maneuvers                       | Conduct Emergency Procedure - Emergency Descent                         | Can explain declaring an emergency and selection of a suitable airport or landing location                                                                                                         |
| Flight Profiles and Maneuvers                       | Understand determining accelerate-stop / accelerate-go distance per AFM | Can explain the importance of timely and correct decisions related to rejected takeoffs (RTO)                                                                                                      |
| Flight Profiles and Maneuvers                       | Understand determining accelerate-stop / accelerate-go distance per AFM | Can explain the importance of timely decisions in relation $V_1$                                                                                                                                   |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------|----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                            | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                           |
| Flight Profiles and Maneuvers                       | Understand Mitigating Risks of an Incorrect Airport Surface Approach and Landing | Can explain how use of published approach guidance in visual conditions can reduce errors                                                                                                                                                                                                                                                                                                           |
| Flight Profiles and Maneuvers                       | Conduct Taxi                                                                     | Can identify The runway and taxiway characteristics concerning width, safety areas, obstacle free zones, markings, hold lines, signs, holding spots, runway slope, suitability of threshold crossing height (TCH), critical area protection, taxiway position markings, runway distance remaining markings, runway distance remaining signs, and LVO/SMGCS should be addressed.                     |
| Flight Profiles and Maneuvers                       | Understand Specific Flight Characteristics                                       | Can identify expected minimum visual references that occur on approach when the weather is at acceptable minimum conditions as well as the expected sequence of visual cues during an approach in which the visibility is at or above the specified landing minima. Training on this topic should include identifying required visual references over a range of actual or simulated low-visibility |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                    | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain proper recovery procedures should emphasize that a reduction of the AOA is required to initiate recovery of all stall events. Additional information to incorporate into recovery training includes: Recognition of impending stall indications and understanding of the need to initiate the stall recovery procedure at an impending stall.                                                                                                                                           |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain proper recovery procedures should emphasize that a reduction of the AOA is required to initiate recovery of all stall events. Additional information to incorporate into recovery training includes: Recognition of full stall indication (see paragraph 1-7) with the realization that most swept-wing transport category aircraft exhibit full stall characteristics different from those typically experienced in General Aviation (GA) aircraft used during certification training. |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain proper recovery procedures should emphasize that a reduction of the AOA is required to initiate recovery of all stall events. Additional information to incorporate into recovery training includes: For airplanes equipped with a stick pusher, recommended recovery actions in response to stick pusher activation.                                                                                                                                                                   |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                          |                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                    | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                               |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain proper recovery procedures should emphasize that a reduction of the AOA is required to initiate recovery of all stall events. Additional information to incorporate into recovery training includes: Avoiding cyclical or oscillatory control inputs to prevent exceeding the structural limits of the airplane.                                                                            |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain proper recovery procedures should emphasize that a reduction of the AOA is required to initiate recovery of all stall events. Additional information to incorporate into recovery training includes: Structural considerations, including explanation of limit load, ultimate load, and the dangers of combining accelerative and rolling moments (i.e., the rolling pull) during recovery. |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain proper recovery procedures should emphasize that a reduction of the AOA is required to initiate recovery of all stall events. Additional information to incorporate into recovery training includes: The necessity for smooth, deliberate, and positive control inputs to avoid unacceptable load factors and secondary stalls.                                                             |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                    | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain proper recovery procedures should emphasize that a reduction of the AOA is required to initiate recovery of all stall events. Additional information to incorporate into recovery training includes: AOA must be reduced prior to controlling roll.                                                                                                                                                                                                                       |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain proper recovery procedures should emphasize that a reduction of the AOA is required to initiate recovery of all stall events. Additional information to incorporate into recovery training includes: Effectiveness of control surfaces and the order in which the control surfaces lose and regain their effectiveness (e.g., spoilers, ailerons, etc.).                                                                                                                  |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain proper recovery procedures should emphasize that a reduction of the AOA is required to initiate recovery of all stall events. Additional information to incorporate into recovery training includes: If a terrain awareness warning system (TAWS) warning is encountered during recovery from a low altitude stall event, recovery from the stall warning should take precedence. Once the airplane recovers from the stall event, then execute the TAWS escape maneuver. |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                          |                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                    | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                             |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: AOA versus pitch angle.                                                                                                               |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: Rate of onset including rate of airspeed decay (both low and high).                                                                   |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: Airplane configuration and condition including weight, center of gravity (CG), landing gear, flaps/slats, spoilers/speed brakes, etc. |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: Asymmetric loading including thrust asymmetries, wing loading due to roll or yaw transients or uncoordinated flight.                  |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: G loading.                                                                                                                            |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: Bank angle.                                                                                                                           |

|-----------------------------------------------------|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                    | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                      |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: Thrust and lift vectors.                                       |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: Thrust required versus thrust available.                       |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: Wind shear.                                                    |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: Altitude.                                                      |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: Mach effects.                                                  |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: Situational Awareness.                                         |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: Mode confusion, including unexpected/unannounced mode changes. |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                          |                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                    | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                       |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: Unexpected transition from automated to manual flight.                                                                          |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain an awareness of the factors that may lead to a stall event during automated and manual flight operations including: Contamination (ice), including the effect of icing on stall speed and stall warnings.                                           |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can demonstrate an understanding of AOA indicators (if installed) or interpretation of other representations of AOA such as pitch-limit indicators or speed display symbology that can assist in stall prevention.                                              |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain specific stall and low-speed buffet characteristics unique to the airplane type and any implications for the expected flight operations and airplane-specific stall recovery procedure (e.g., underwing mounted engines, t-tail, propellers, etc.). |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain for envelope protected airplanes, stall protection capabilities in normal and degraded modes.                                                                                                                                                       |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can describe thrust settings and its application.                                                                                                                                                                                                               |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can demonstrate awareness of autoflight mode indications.                                                                                                                                                                                                       |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                          |                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                    | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                     |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain incorrect use of (including input errors) flightpath automated systems.                                                                                                                                                                                                                                                                           |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain the operation and function of stall protection systems in normal, abnormal, and emergency situations, including the hazards of overriding or ignoring stall protection system indications. Awareness of the factors that may lead such systems to fail, as well as degraded modes, indications, or behaviors that may occur with system failures. |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain buffet boundary and margins in flight planning and operational flying.                                                                                                                                                                                                                                                                            |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain the lower margins for stall onset and recovery (i.e., coffin corner) and possible buffet cueing differences on the high-speed versus the low-speed margin.                                                                                                                                                                                        |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain the principles of high altitude aerodynamics, performance capabilities, and limitations; including high altitude operations and flight techniques (i.e., the need to avoid secondary stall by extended nose-down recovery, compared to lower altitudes).                                                                                          |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                    | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain the differences in airplane performance (e.g., thrust available) during high versus low altitude operations, the effects of those differences on stall recovery, and the anticipated altitude loss during a recovery.                                                                                                                                                                                                                                                                     |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can explain the differences between transport category airplane certification and GA airplane certification regarding use of flight controls at high AOA. For example, if the roll control system is compromised and the ailerons are unable to produce the required roll recovery, the rudder may be used with care during stall prevention and recovery. To maintain structural integrity, it is important to guard against control reversals—avoid rapid full-scale reversal of control deflection |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                    | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Flight Profiles and Maneuvers                       | Understand Stall Prevention and Recovery | Can demonstrate general awareness of example events. Although significant emphasis should be placed on preventing stall events, it is important for pilots to understand that, although rare, stall events continue to occur. Studying the causes and contributing factors of stall events give pilots more knowledge to help prevent or if necessary, recover from a stall event. A review of stall-related accidents, incidents, ASAP, FOQA, and ASRS data for the specific airplane type or class should be included in ground training. |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Flight Profiles and Maneuvers                       | Conduct Stall Prevention and Recovery Scenario per AC120-109A | Can explain the STICK PUSHER. For airplanes equipped with a stick pusher, stall recovery training includes ground training and practical training in an FFS. It is important for pilots to experience the sudden forward movement of the control yoke/stick during a stick pusher activation. From observations, most instructors state that, regardless of previous academic training, pilots usually resist the stick pusher on their first encounter. Usually, they immediately pull back on the control yoke/stick rather than releasing pressure as they have been taught. Therefore, pilots must receive practical stick pusher training in an FFS to develop the proper response (allowing the pusher to reduce AOA) when confronted with a stick pusher activation. Stick pusher training should be completed as a demonstration/practice exercise, including repetitions, until the pilot's reaction is to permit the reduction in AOA even at low altitudes. Pilot response to a deliberate activation of the pusher is not a checked maneuver. |
| Flight Profiles and Maneuvers                       | Conduct Emergency Procedure - EGPWS escape maneuver           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Hydraulic System                                    | Understand Hydraulic system - allowable types of fluid |                                           |
| Hydraulic System                                    | Understand Hydraulic system - regulators/accumulators  |                                           |
| Hydraulic System                                    | Understand Hydraulic system - regulators/accumulators  |                                           |
| Hydraulic System                                    | Understand Hydraulic system - regulators/accumulators  |                                           |
| Hydraulic System                                    | Understand Hydraulic system - regulators/accumulators  |                                           |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                  |                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                            | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                              |
| Ice Protection                                      | Understand ground operations in icing conditions | Can explain that regulations prohibit takeoff when snow, ice, or frost is adhering to wings, propellers, or control surfaces of an aircraft.                                                                                                                           |
| Ice Protection                                      | Understand ground operations in icing conditions | Can explain that the degradation in aircraft performance and changes in flight characteristics when frozen contaminants are present are wide ranging, unpredictable, and highly dependent upon individual aircraft design                                              |
| Ice Protection                                      | Understand ground operations in icing conditions | Can explain that the PIC has the ultimate responsibility to determine if the aircraft is clean and that the aircraft is in a condition for safe flight.                                                                                                                |
| Ice Protection                                      | Understand ground operations in icing conditions | Can explain that in order to achieve compliance with the clean aircraft concept, it is imperative that takeoff not be attempted in any aircraft unless the pilot-in-command (PIC) is certain that critical components of the aircraft are free of frozen contaminants. |
| Ice Protection                                      | Understand ground operations in icing conditions | Can explain that for aircraft type specific procedures, pilots should refer to the aircraft flight manuals or other manufacturer documents developed for that particular type aircraft                                                                                 |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                            | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                           |
| Ice Protection                                      | Understand ground operations in icing conditions | Can explain that icing conditions (during flight or ground operations) can occur, and ice protection systems or procedures should be activated when OAT is below 50 degrees F (10 degrees C) and visible moisture in any form is present or when there is standing water, ice, or snow on the runway and/or taxiways.                                                                                                               |
| Ice Protection                                      | Understand ground operations in icing conditions | Can explain that residual ice or slush accumulated on airframe components during landing and taxi operations on contaminated runways, taxiways and ramps, can remain in place if low temperatures and other weather conditions exist unless identified and removed. Contaminants of this type are commonly found in wheel wells, on landing gear components, trailing edge flaps, undersurfaces of wings and horizontal stabilizers |
| Ice Protection                                      | Understand ground operations in icing conditions | Can explain that the deicing process is intended to restore the aircraft to a clean configuration so that neither degradation of aerodynamic characteristics nor mechanical interference from contaminants will occur                                                                                                                                                                                                               |
| Ice Protection                                      | Understand ground operations in icing conditions | Can explain that it is essential that the PIC have a thorough understanding of the deicing and anti-icing process and the approved procedures necessary to ensure that the aircraft is clean for takeoff.                                                                                                                                                                                                                           |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                            |                                                                                                                                                                                            |
|-----------------------------------------------------|------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                      | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                                  |
| Ice Protection                                      | Understand ground operations in icing conditions           | Can explain that anti-icing should be performed as near to the takeoff time as possible to minimize the risk of exceeding the useful life or time of effectiveness of the anti-icing fluid |
| Ice Protection                                      | Understand Ice Protection - anti-ice & de-ice.             | Can describe the operation of the airplane systems and components using correct terminology                                                                                                |
| Ice Protection                                      | Understand Ice Protection - anti-ice & de-ice.             | Can explain system or component limitations                                                                                                                                                |
| Ice Protection                                      | Understand Ice Protection - anti-ice & de-ice.             | Can explain all notes cautions or warnings listed in the OEM manuals & OEM manuals                                                                                                         |
| Ice Protection                                      | Understand Ice Protection - anti-ice & de-ice.             | Can explain immediate action items or memory items, if appropriate                                                                                                                         |
| Ice Protection                                      | Understand Ice Protection - anti-ice & de-ice.             | Can use the appropriate checklists and NORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem or device                                             |
| Ice Protection                                      | Understand Ice Protection - anti-ice & de-ice.             | Can use the appropriate checklists and ABNORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem, or device                                          |
| Ice Protection                                      | Understand Ice Protection - pitot-static system protection | Can describe the operation of the airplane systems and components using correct terminology                                                                                                |
| Ice Protection                                      | Understand Ice Protection - pitot-static system protection | Can explain system or component limitations                                                                                                                                                |
| Ice Protection                                      | Understand Ice Protection - pitot-static system protection | Can explain all notes cautions or warnings listed in the OEM manuals & OEM manuals                                                                                                         |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                            |                                                                                                                                                   |
|-----------------------------------------------------|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                      | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                         |
| Ice Protection                                      | Understand Ice Protection - pitot-static system protection | Can explain immediate action items or memory items, if appropriate                                                                                |
| Ice Protection                                      | Understand Ice Protection - pitot-static system protection | Can use the appropriate checklists and NORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem or device    |
| Ice Protection                                      | Understand Ice Protection windshield                       | Can describe the operation of the airplane systems and components using correct terminology                                                       |
| Ice Protection                                      | Understand Ice Protection windshield                       | Can explain system or component limitations                                                                                                       |
| Ice Protection                                      | Understand Ice Protection windshield                       | Can explain all notes cautions or warnings listed in the OEM manuals & OEM manuals                                                                |
| Ice Protection                                      | Understand Ice Protection windshield                       | Can explain immediate action items or memory items, if appropriate                                                                                |
| Ice Protection                                      | Understand Ice Protection windshield                       | Can use the appropriate checklists and NORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem or device    |
| Ice Protection                                      | Understand Ice Protection windshield                       | Can use the appropriate checklists and ABNORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem, or device |
| Ice Protection                                      | Understand Ice Protection airfoil surfaces                 | Can describe the operation of the airplane systems and components using correct terminology                                                       |
| Ice Protection                                      | Understand Ice Protection airfoil surfaces                 | Can explain system or component limitations                                                                                                       |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                            |                                                                                                                                                   |

| Lighting                                            | Understand Lighting                          | Can use the appropriate checklists and NORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem or device    |
| Lighting                                            | Understand Lighting                          | Can use the appropriate checklists and ABNORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem, or device |
| Lighting                                            | Understand Lighting                          |                                                                                                                                                   |
| Lighting                                            | Understand Lighting                          |                                                                                                                                                   |
| Lighting                                            | Understand Lighting                          |                                                                                                                                                   |
| Lighting                                            | Understand Lighting                          |                                                                                                                                                   |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                        |                                                                                                                                                                               |
|-----------------------------------------------------|------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                  | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                     |
| MEL and CDL                                         | Understand Crew and Passenger Emergency Equipment - emergency exits    | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Electrical System - alternators                             | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Electrical System - generators                              | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Electrical System - circuit breakers and protection devices | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Electrical System - controls                                | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Electrical System - indicators                              | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                                           |                                                                                                                                                                               |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                                              | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                          |
| MEL and CDL                                                | Understand Electrical System - external and auxiliary power sources. (ground power and APU)               | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Lighting                                                                                       | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Pitot Static System - associated instruments and the power source for those flight instruments | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Pitot Static System - Operation and power sources for other flight instruments                 | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Avionics and communications - autopilot                                                        | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Avionics and communications - Electronic Flight Instrument Systems (EFIS)                      | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                         |                                                                                                                                                                               |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                                   | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                     |
| MEL and CDL                                         | Understand Avionics and communications - Flight Management System (FMS)                 | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Avionics and communications - Radar                                          | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Avionics and communications - Inertial Navigation Systems (INS)              | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Avionics and communications - Global Navigation Satellite System (GNSS)      | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Avionics and communications - ground-based navigation systems and components | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Avionics and communications - transponder                                    | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                                          |                                                                                                                                                                               |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                                             | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                          |
| MEL and CDL                                                | Understand Avionics and communications - Automatic Dependent Surveillance – Broadcast (ADS-B) In and Out | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Avionics and communications - ADS – Contract (ADS-C)                                          | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Avionics and communications - traffic awareness/warning/avoidance systems                     | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Avionics and communications - terrain awareness/warning/alert systems                         | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Avionics and communications - communication systems (e.g., data link, UHF/VHF/HF, satellite)  | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Avionics and communications - communication systems (e.g., data link, UHF/VHF/HF, satellite)  | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                         |                                                                                                                                                                               |
|------------------------------------------------------------|-------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                            | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                          |
| MEL and CDL                                                | Understand Avionics and communications - indicating devices             | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Avionics and communications - emergency locator transmitter. | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Powerplant - turbine wheels                                  | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Powerplant - compressors                                     | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Powerplant - deicing, anti-icing                             | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Powerplant - controls and indications                        | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                            |                                                                                                                                                                               |
|-----------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                      | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                     |
| MEL and CDL                                         | Understand Powerplant - oil system capacity and quantities | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Powerplant - allowable types of oil             | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Powerplant - thrust reverse                     | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Propellers - type                               | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand propellers - feathering/unfeathering            | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand propellers - auto-feather                       | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                             |                                                                                                                                                                               |
|------------------------------------------------------------|-----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                          |
| MEL and CDL                                                | Understand propellers - negative torque sensing                             | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand propellers - synchronizing                                       | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand propellers - synchrophasing                                      | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand propeller - thrust reverse and uncommanded reverse               | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Auxiliary Power Unit (APU)                                       | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Fire & smoke detection, protection, and suppression - powerplant | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                                                                                   |                                                                                                                                                                               |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                                                                                      | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                          |
| MEL and CDL                                                | Understand Fire & smoke detection, protection, and suppression - cargo and passenger compartments                                                 | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Fire & smoke detection, protection, and suppression - lavatory                                                                         | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Fire & smoke detection, protection, and suppression - pneumatic and environmental                                                      | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Fire & smoke detection, protection, and suppression - electrical/avionics, and batteries (on-aircraft and personal electronic devices) | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Fuel system - capacity and quantities                                                                                                  | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Fuel system - drains                                                                                                                   | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                  |                                                                                                                                                                               |
|------------------------------------------------------------|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                     | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                          |
| MEL and CDL                                                | Understand Fuel system - pumps                   | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Fuel system - controls and indicators | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Fuel system - fuel substitutions      | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Fuel system - cross-feeding           | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Fuel system - transferring            | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Fuel system - jettison                | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                           |                                                                                                                                                                               |
|-----------------------------------------------------|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                     | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                     |
| MEL and CDL                                         | Understand Fuel system - fuel grade                       | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Fuel system - additives                        | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Fuel system - fueling and defueling procedures | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Hydraulic system - capacity                    | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Hydraulic system - pumps                       | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Hydraulic system - pressure                    | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                        |                                                                                                                                                                               |
|-----------------------------------------------------|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                  | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                     |
| MEL and CDL                                         | Understand Hydraulic system - reservoirs               | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Hydraulic system - allowable types of fluid | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Hydraulic system - regulators/accumulators  | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Landing Gear - extension/retraction system  | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Landing Gear - indicators                   | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Landing Gear - brakes                       | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                              |                                                                                                                                                                               |
|-----------------------------------------------------|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                        | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                     |
| MEL and CDL                                         | Understand Landing Gear - antiskid           | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Landing Gear - tires              | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Landing Gear - nosewheel steering | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Landing Gear - shock absorbers    | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Flight Controls - Ailerons        | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Flight Controls - elevator        | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                 |                                                                                                                                                                               |
|-----------------------------------------------------|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                           | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                     |
| MEL and CDL                                         | Understand Flight Controls - rudder                             | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Flight Controls - control tabs                       | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Flight Controls - control boost/augmentation systems | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Flight Controls - flaps                              | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Flight Controls - spoilers                           | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Flight Controls - leading edge devices               | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                               |                                                                                                                                                                               |
|-----------------------------------------------------|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                         | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                     |
| MEL and CDL                                         | Understand Flight Controls - speed brakes                                     | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Flight Controls - stability augmentation system (e.g., yaw damper) | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Flight Controls - trim systems                                     | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Ice Protection - anti-ice & de-ice.                                | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Ice Protection - pitot-static system protection                    | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Ice Protection windshield                                          | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                              |                                                                                                                                                                               |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                                 | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                                                          |
| MEL and CDL                                                | Understand Ice Protection airfoil surfaces                                                   | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Pneumatic and environmental system - heating, cooling, ventilation                | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Pneumatic and environmental system - pressurization                               | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Pneumatic and environmental system - supply for ice protection systems            | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Pneumatic and environmental system - controls, indicators, and regulating devices | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                                | Understand Crew and Passenger Equipment - oxygen system                                      | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                                            |                                                                                                                                                                               |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                                      | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                                                                     |
| MEL and CDL                                         | Understand Crew and Passenger Equipment - quick donning oxygen mask for crewmembers        | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Crew and Passenger Equipment - passenger oxygen system                          | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| MEL and CDL                                         | Understand Envelope protection—angle of attack warning and protection and speed protection | Can apply the use of a Minimum Equipment List (MEL) and a Configuration Deviation List (CDL) to document inoperative components of this system and explain related procedures |
| Oil System                                          | Understand Powerplant - oil system capacity and quantities                                 | Can describe the operation of the airplane systems and components using correct terminology                                                                                   |
| Oil System                                          | Understand Powerplant - oil system capacity and quantities                                 | Can explain system or component limitations                                                                                                                                   |
| Oil System                                          | Understand Powerplant - oil system capacity and quantities                                 | Can explain all notes cautions or warnings listed in the OEM manuals & OEM manuals                                                                                            |
| Oil System                                          | Understand Powerplant - oil system capacity and quantities                                 | Can explain immediate action items or memory items, if appropriate                                                                                                            |
| Oil System                                          | Understand Powerplant - oil system capacity and quantities                                 | Can use the appropriate checklists and NORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem or device                                |

| <b>HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES</b> |                                                                                     |                                                                                                                                                   |
|------------------------------------------------------------|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>COURSE 1</b>                                            | <b>TASKS</b>                                                                        | <b>KNOWLEDGE &amp; COGNITIVE LEARNING OBJECTIVES</b>                                                                                              |
| Oil System                                                 | Understand Powerplant - oil system capacity and quantities                          | Can use the appropriate checklists and ABNORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem, or device |
| Oxygen                                                     | Understand Crew and Passenger Equipment - oxygen system                             | Can describe the operation of the airplane systems and components using correct terminology                                                       |
| Oxygen                                                     | Understand Crew and Passenger Equipment - oxygen system                             | Can explain system or component limitations                                                                                                       |
| Oxygen                                                     | Understand Crew and Passenger Equipment - oxygen system                             | Can explain all notes cautions or warnings listed in the OEM manuals & OEM manuals                                                                |
| Oxygen                                                     | Understand Crew and Passenger Equipment - oxygen system                             | Can explain immediate action items or memory items, if appropriate                                                                                |
| Oxygen                                                     | Understand Crew and Passenger Equipment - oxygen system                             | Can use the appropriate checklists and NORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem or device    |
| Oxygen                                                     | Understand Crew and Passenger Equipment - oxygen system                             | Can use the appropriate checklists and ABNORMAL procedures to demonstrate or describe the proper use of the airplane system, subsystem, or device |

| Thrust Reverse                                      | Understand Powerplant - thrust reverse                                    |                                                                                                                                                                                       |
| Thrust Reverse                                      | Understand Powerplant - thrust reverse                                    |                                                                                                                                                                                       |
| Weight and Balance                                  | Understand Avionics and communications - Electronic Flight Bag (EFB)      | Can reference air carrier weight and balance procedures if applicable                                                                                                                 |
| Weight and Balance                                  | Understand determining weight and balance per AFM                         | Can explain and demonstrate the use of charts, tables, and data to determine performance                                                                                              |
| Weight and Balance                                  | Understand determining weight and balance per AFM                         | Can demonstrate proficient use of appropriate performance charts, tables, graphs, or other data to determine airplane performance and limitations for all phases of flight            |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can define windshear as any rapid change in wind direction or velocity                                                                                                                |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can define severe windshear as a rapid change in wind direction or velocity causing airspeed changes greater than 15 knots or vertical speed changes greater than 500 feet per minute |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                           |                                                                                                             |
|-----------------------------------------------------|---------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                     | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                   |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can define Increasing Headwind Shear as windshear in which headwind increases, causing an airspeed increase |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can define Decreasing Headwind Shear as windshear in which headwind decreases, causing an airspeed loss     |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can define Increasing Tailwind Shear as windshear in which tailwind increases, causing an airspeed loss     |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can define Decreasing Tailwind Shear as windshear in which tailwind decreases, causing an airspeed increase |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can discuss the characteristics of a microburst                                                             |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can discuss windshear recognition                                                                           |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can discuss windshear pilot technique                                                                       |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can discuss windshear encounter during takeoff after liftoff                                                |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can discuss windshear encounter during takeoff while on the runway                                          |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can discuss windshear encounter on the approach                                                             |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can discuss takeoff precautions                                                                             |

| HS-125 COURSE 1 – GROUND SCHOOL LEARNING OBJECTIVES |                                                                           |                                                                             |
|-----------------------------------------------------|---------------------------------------------------------------------------|-----------------------------------------------------------------------------|
| COURSE 1                                            | TASKS                                                                     | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                   |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can discuss approach precautions                                            |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can discuss general windshear recovery technique                            |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can discuss windshear recovery technique after liftoff/on approach          |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can discuss windshear recovery technique during takeoff/on runway           |
| Windshear                                           | Understand recognizing and escaping severe weather situations (windshear) | Can discuss why other techniques of recovery reduce the chances of survival |

### 3 Systems Integration Training Learning Objectives – Course 1

#### 3.1 Course 1 – SIT 1 Learning Objectives

| HS-125 COURSE 1 - SYSTEMS INTEGRATION TRAINING (SIT) 1 |                                           |                                 |                                                                                                                                                                                                 |                         |
|--------------------------------------------------------|-------------------------------------------|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| TASKS                                                  | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES | MOTOR SKILL LEARNING OBJECTIVES | ATTITUDE LEARNING OBJECTIVES                                                                                                                                                                    | TASK EXPECTATION RATING |
| Conduct Before Takeoff Checks                          |                                           |                                 | Can manage the risk of errors when assigned an RNAV DP and subsequently receives a change of runway, procedure or transition by verifying the appropriate changes are entered and available for | Low                     |

| HS-125 COURSE 1 - SYSTEMS INTEGRATION TRAINING (SIT) 1 |                                                                            |                                 |                              |                         |
|--------------------------------------------------------|----------------------------------------------------------------------------|---------------------------------|------------------------------|-------------------------|
| TASKS                                                  | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                  | MOTOR SKILL LEARNING OBJECTIVES | ATTITUDE LEARNING OBJECTIVES | TASK EXPECTATION RATING |
|                                                        |                                                                            |                                 | navigation prior to takeoff. |                         |
| Conduct Before Takeoff Checks                          | Can explain the purpose of checking each item during before takeoff checks |                                 |                              | Low                     |
| Conduct Before Takeoff Checks                          | Can describe how to detect malfunctions                                    |                                 |                              | Low                     |
| Conduct Before Takeoff Checks                          | Can ensure the aircraft is in safe operating condition                     |                                 |                              | Low                     |
| Conduct Before Takeoff Checks                          | Can explain deicing and anti icing procedures                              |                                 |                              | Low                     |

| HS-125 COURSE 1 - SYSTEMS INTEGRATION TRAINING (SIT) 1 |                                                                                                                              |                                 |                              |                         |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|---------------------------------|------------------------------|-------------------------|
| TASKS                                                  | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES                                                                                    | MOTOR SKILL LEARNING OBJECTIVES | ATTITUDE LEARNING OBJECTIVES | TASK EXPECTATION RATING |
| Conduct Before Takeoff Checks                          | Can explain hold over times by referencing to a hold over chart                                                              |                                 |                              | Low                     |
| Conduct Before Takeoff Checks                          | Can describe how to conduct a proper pre-takeoff contamination check                                                         |                                 |                              | Low                     |
| Conduct Before Takeoff Checks                          | Can describe how adverse weather conditions effect takeoff performance (e.g., snow, ice, gusting crosswinds, low-visibility) |                                 |                              | Low                     |

| HS-125 COURSE 1 - SYSTEMS INTEGRATION TRAINING (SIT) 1 |                                           |                                                                                                       |                              |                         |
|--------------------------------------------------------|-------------------------------------------|-------------------------------------------------------------------------------------------------------|------------------------------|-------------------------|
| TASKS                                                  | KNOWLEDGE & COGNITIVE LEARNING OBJECTIVES | MOTOR SKILL LEARNING OBJECTIVES                                                                       | ATTITUDE LEARNING OBJECTIVES | TASK EXPECTATION RATING |
| Conduct Before Takeoff Checks                          | Can give a before takeoff briefing        |                                                                                                       |                              | Low                     |
| Conduct Before Takeoff Checks                          |                                           | Can determine the airplane's takeoff performance for actual conditions and planned departure runway   |                              | Low                     |
| Conduct Before Takeoff Checks                          |                                           | Can coordinate with crew and execute the appropriate checklist(s) prior to takeoff in a timely manner |                              | Low                     |

| HS-125 COURSE 1 - SYSTEMS INTEGRATION TRAINING (SIT) 1 |                                                    |                                                                                                                                               |                                    |                               |
|--------------------------------------------------------|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|-------------------------------|

| TASKS                                                  | KNOWLEDGE<br>& COGNITIVE<br>LEARNING<br>OBJECTIVES                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | MOTOR<br>SKILL<br>LEARNING<br>OBJECTIVES | ATTITUDE<br>LEARNING<br>OBJECTIVES | TASK<br>EXPECTATION<br>RATING |
| Conduct<br>Instrument<br>Takeoff                       | Can describe procedures during takeoff to address the transition from visual flight to instrument flight for both the pilot flying (PF) and pilot monitoring (PM), to include the use and limitations of any flight guidance or visual systems in use. Pilots should be aware of the operator's policy for responding to loss of suitable visual reference during takeoff, in the low and high speed regimes, both before and after V1 (refer to AC 120-62 for additional information and recommendations for training). |                                          |                                    | Medium                        |

| TASKS                                        | MOTOR SKILL LEARNING OBJECTIVES                                                                                                                                                                                                                        | ATTITUDE LEARNING OBJECTIVES | TASK EXPECTATION RATING |
| Conduct Landing From a Precision Approach    | Can maintain the desired airspeed, $\pm 5$ knots, and vertical and lateral guidance within $\frac{1}{4}$ -scale deflection of the indicators during the descent from DA/DH to a point where visual maneuvering is used to accomplish a normal landing. |                              | Medium                  |
| Conduct Landing From a Precision Approach    | Can comply with all ATC advisories, such as NOTAMs, windshear, wake turbulence, runway surface, braking conditions, and other operational considerations.                                                                                              |                              | Medium                  |
| Conduct Landing From a Precision Approach    | Can execute touch down at the appropriate speed and pitch attitude at the runway aiming point markings, -250/+500 feet, or where there are no runway markings 750 to 1,500 feet from the approach threshold of the runway                              |                              | Medium                  |
| Conduct Landing From a Precision Approach    | Can maintain positive airplane control throughout the landing using drag and braking devices, as appropriate, to come to a stop.                                                                                                                       |                              | Medium                  |

| HS-125 COURSE 1 - SIMULATOR (SIM) TRAINING 1 |                                                  |                                                                                                                                                                                                       |                         |

| TASKS                                        | MOTOR SKILL LEARNING OBJECTIVES                                                                                                                                                                                             | ATTITUDE LEARNING OBJECTIVES | TASK EXPECTATION RATING |
| Conduct Precision Approach                   | Can comply in a timely manner with all clearances, instructions, and procedures.                                                                                                                                            |                              | Medium                  |
| Conduct Precision Approach                   | Can recognize if any flight instrumentation is inaccurate or inoperative, and take appropriate action.                                                                                                                      |                              | Medium                  |
| Conduct Precision Approach                   | Can coordinate with ATC if unable to comply with a clearance.                                                                                                                                                               |                              | Medium                  |
| Conduct Precision Approach                   | Can maintain the appropriate airplane configuration and airspeed considering meteorological and operating conditions.                                                                                                       |                              | Medium                  |
| Conduct Precision Approach                   | Can maintain altitude $\pm 100$ feet, selected heading $\pm 5^\circ$ , airspeed $\pm 10$ knots, and perform tracking of radials, courses, and bearings, prior to beginning the final approach segment.                      |                              | Medium                  |
| Conduct Precision Approach                   | Can assess NOTAMs, inoperative aircraft or navigation equipment, or inoperative visual aids associated with the landing environment and adjust the published MDA and visibility criteria for the aircraft approach category |                              | Medium                  |

| HS-125 COURSE 1 - SIMULATOR (SIM) TRAINING 1 |                                                                                                                                                                                                                                     |                              |                         |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|-------------------------|
| TASKS                                        | MOTOR SKILL LEARNING OBJECTIVES                                                                                                                                                                                                     | ATTITUDE LEARNING OBJECTIVES | TASK EXPECTATION RATING |
| Conduct Precision Approach                   | Can initiate and maintain a predetermined rate of descent which approximates that required for the aircraft to follow the vertical guidance, at the point where vertical guidance begins                                            |                              | Medium                  |
| Conduct Precision Approach                   | Can maintain a stabilized final approach from the Final Approach Fix (FAF) to DA/DH allowing no more than ¼-scale deflection of either the vertical or lateral guidance indications and maintain the desired airspeed $\pm 5$ knots |                              | Medium                  |
| Conduct Precision Approach                   | Can immediately initiate the missed approach procedures if the required visual references for the runway are not distinctly visible and identifiable upon reaching the DA/DH.                                                       |                              | Medium                  |

| HS-125 COURSE 1 - SIMULATOR (SIM) TRAINING 1 |                                                                                                                                                                                                                            |                                                                                                                                                      |                         |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|

| Conduct Stick Shaker/Pusher Demonstration    | Can appreciate the STICK PUSHER. For airplanes equipped with a stick pusher, stall recovery training includes ground training and practical training in an FFS. It is important for pilots to experience the sudden forward movement of the control yoke/stick during a stick pusher activation. From observations, most instructors state that, regardless of previous academic training, pilots usually resist the stick pusher on their first encounter. Usually, they immediately pull back on the control yoke/stick rather than releasing pressure as they have been taught. Therefore, pilots must receive practical stick pusher training in an FFS to develop the proper response (allowing the pusher to reduce AOA) when confronted with a stick pusher activation. Stick pusher training should be completed as a demonstration/practice exercise, including repetitions, until the pilot's reaction is to permit the reduction in AOA even at low altitudes. Pilot response to a deliberate |                                                                                                                               | Medium                  |
