1.6 Arrival Fixes by Departure Airport

Arrival fixes were assigned based on the location of the departure airport. **Exhibits 1-7** and **1-8** depict the arrival fix assignments for West Flow and East Flow, respectively.

1.7 Taxi Speeds

Taxi speeds were established for taxiways and aprons. **Exhibits 1-9** and **1-10** depict the taxi speeds for West Flow and East Flow, respectively.

1.8 Intersection Departure Procedures

Departures utilizing Runways 9R-27L and 10L-28R are encouraged to use intersection departure procedures whenever possible so that arrivals from the outboard runways (Runways 9L-27R, 9C-27C, 10C-28C, and 10R-28L) can taxi behind departing aircraft, reducing delay incurred by both arriving and departing aircraft. However, some departures cannot use intersection departure procedures due to runway length requirements. A subset of widebody[7] operations that is representative of the characteristics of the operations that typically utilize the full length of the departure runway was restricted from using intersection departure procedures. This subset was defined based on the airline and the great circle distance[8] from O'Hare to the destination airport. **Tables 1-2** and **1-3** detail the air carrier operations and cargo operations, respectively, that were in the DDFS and restricted from using intersection departures.

[7] This refers to aircraft with a fuselage wide enough to accommodate two passenger aisles.

[8] This is the shortest distance between two points on the surface of a sphere, measured along the surface of the sphere.

1.9 Runway Crossing Assumptions

Runway safety areas (RSAs) extend 250 feet to each side of the runway centerline. Aircraft enter the RSA and then exit on the opposite side of the RSA to complete a crossing. The time required for various aircraft to cross a runway depends on the type of crossing and whether the aircraft is repositioning.[9]

Two types of runway crossings were simulated:

- Free Flow Crossing: A crossing where aircraft proceed immediately across the runway without having to wait for arriving or departing aircraft.
  - All operations taxi across the runway at 15 knots.

[9] Runway crossing assumptions for all free flow and non-repositioning impeded crossings were developed during the 2018 O'Hare Calibration. Air Traffic Control provided input for impeded crossings by repositioning aircraft.

- Impeded Crossing: A runway crossing where aircraft are required to stop and wait for arriving or departing aircraft.
  - Non-repositioning operations wait for 25 seconds after the landing or departing aircraft has passed the intersection where the crossing will occur, then taxi across the runway at 15 knots. The simulated total runway crossing time is approximately 50 seconds.
  - Repositioning operations wait for 25 seconds after the landing or departing aircraft has passed the intersection where the crossing will occur, then taxi across the runway at 5 knots. The slower taxi speed accounts for additional time that is necessary to accelerate aircraft being towed by an aircraft tractor.[10] The simulated total runway crossing time is approximately 85 seconds.
  - All operations crossing a runway being utilized by arriving aircraft will be clear of the RSA before the next arrival aircraft is approximately one-half nautical mile from the runway threshold.

For aircraft crossing behind intersection departures, TAAM considers the aircraft ahead of them as occupying the runway. They wait for the preceding aircraft to completely cross the runway before crossing the runway themselves. The width of the RSA was reduced at these points to realistically model representative runway crossing times at these locations.

1.10 Aircraft Separation/Spacing Assumptions

Separation standards define the minimum longitudinal (in front of or behind), lateral (side by side), or vertical (above or below) distances between aircraft. The criterion for aircraft separation and spacing modeled for the TAP and ATP EA is based on the separation minima found in FAA Orders 7110.65Y and 7110.126A, with additional input provided by the Air Traffic Workgroup.

Tables 1-4 and **1-5** list the in-trail separation values for aircraft operating directly behind or on approach, respectively, based on the categories of the leading and following aircraft. The shaded area of Table 1-5 indicates those aircraft pairings that are eligible for a reduced separation of 2.5 nautical miles on approach.[11] **Table 1-6** lists the aircraft types from the DDFS included in each category.

[10] TAAM cannot differentiate between repositioning operations towed by aircraft tractors or taxiing under their own power. Runway crossings were modeled assuming repositioning operations were towed by an aircraft tractor, because these were anticipated to take longer than repositioning operations taxiing under their own power.

[11] All runways, except for Runway 10L, that were utilized for arrival operations in the TAP and ATP EA TAAM modeling are approved, or anticipated to be approved, for a reduced separation of 2.5 nautical miles on final approach.

TABLE 1-4: IN-TRAIL SEPARATION VALUES – DIRECTLY BEHIND

NOTE:

1/ Aircraft listed as Category D or No Weight (NOGWT) in Federal Aviation Administration Order JO 7360.1E were assumed to be Category B for Total Airspace and Airport Modeler (TAAM) modeling.

SOURCES: U.S. Department of Transportation, Federal Aviation Administration, Order JO 7360.1E, *Aircraft Type Designators*, September 17, 2019; Terminal Area Plan and Air Traffic Procedures Environmental Assessment Air Traffic Workgroup, January 2020.

PREPARED BY: Ricondo & Associates, Inc., September 2020.

The 2018 O'Hare Calibration analyzed historical Airport Noise Management System (ANMS) data to identify the maximum frequently occurring arrival and departure rates during visual flight rules (VFR) and instrument flight rules (IFR) conditions. The TAAM model settings were then adjusted accordingly to produce arrival rates consistent with those observed.

1.11 Fly Quiet Program (Noise Abatement Procedures)

The CDA has a nighttime noise abatement program (Fly Quiet Program) at the Airport that is intended to direct aircraft over less-populated areas, such as forest preserves, highways, and commercial or industrial areas. The Fly Quiet Program is a voluntary program that encourages pilots and FAA air traffic controllers to use designated nighttime preferential runways and flight tracks developed by the CDA in cooperation with the O'Hare Noise Compatibility Commission (ONCC), the airlines, and the air traffic controllers. The existing *Fly Quiet Program Manual* can be found in **Appendix D**.

As part of the Fly Quiet Program, the following runways are recommended for preferential use between 2200 and 0700 to minimize the effects of nighttime noise:

- Runway 10L-28R
- Runway 9R-27L
- Runway 4L-22R
- Runway 4R-22L

Deviations from the recommended runway use and procedures occur. Weather conditions, runway closures, loss of navigation aids, air traffic demand, airfield operating restrictions, and pilot requests can result in the use of runways other than those designated as Fly Quiet Program preferential runways.

The TAAM simulations are consistent with the existing Fly Quiet Program preferred runways and procedures. The CDA and the FAA provided guidance on the times that the Fly Quiet Program procedures should be implemented. Fly Quiet Program procedures were started at or after 2200 and stopped at or prior to 0700 based on the air traffic demands for each scenario. The specific noise abatement procedures for each operating configuration are included in Sections 3.1.7, 4.1.7, 5.1.7, 6.1.7, 7.1.7, and 8.1.7.

2. TAAM Simulation Summary Results

2.1 TAAM Reporting

Delay calculations were prepared using data contained in the TAAM report (.rep) and message (.msg) output files. The Total Airport Delay was an average of all flights and was calculated using the data contained in a report file. Each flight's delay is the summation of the following five delay categories:

- Arrival Sequencing and Vectoring Air Delay at O'Hare is an average of all arrivals and is calculated using data contained in the report file (apt_delay{rwy/seq delays}).
- Departure Ground Delay at O'Hare is an average of all departures. It is calculated using data contained in the report file and is the sum of taxi delays (taxi_usage{delay_time}) and runway delays (apt_delay{rwy/seq delays}).
- Arrival Ground Delay at O'Hare is an average of all arrivals, calculated using data contained in the report file, and is the sum of taxi delays (taxi_usage{delay_time}) and standoff delay (apt_standoff_delay{join_queue_time, leave_queue_time}). Standoff delay is the difference between when an aircraft enters and leaves the standoff queue.
- Arrival Pre-Departure Ground Delay at Origin is an average of all arrivals and is calculated using data contained in the message (.msg) file. Flights experiencing this delay are denoted by the phrase, "In-trail delay at start of (delay) sec due to (flight number)."
- Departure Gate Delay at O'Hare is an average of all departures, calculated using data contained in the report file, and is the sum of positioning delay (apt_delay{pos_delays}) and gate delay (apt_delay{gate}).

2.2 Peak Operations, Delay, and Travel Times

Multi-iteration statistical outputs from Experiments 911 through 916 are summarized in **Tables 2-1** through **2-9**. The iteration with the median delay was selected for post processing. The following definitions identify and describe each of the components shown in the tables:

- **Operations and terminations:** Scheduled operations are the number of flights in the timetable to be simulated. Processed operations are the number of flights actually simulated. The difference is the number of flights terminated during the simulation.
- **Peak operations:** To describe peak operations one must first define the operational peak. The operational peak is the simulation period during which the highest number of operations occurs based on a rolling-hour or rolling 15-minute count.
- **Rolling-hour count:** To perform a rolling-hour count of operations, each aircraft's time is first rounded down to the nearest 10 minutes. All aircraft having the same rounded time are aggregated into a 10-minute "bucket." The number of aircraft contained in the first six time buckets (#1 through

#6) is the first full-hour count. The second rolling-hour count is the number of aircraft contained in buckets #2 through #7. The remaining rolling-hour counts are determined by summing groups of six 10-minute buckets until the last bucket is counted in a rolling hour. The time coinciding with the last bucket in the largest rolling-hour count is identified as the peak hour.

- **Rolling 15-minute count:** To perform a rolling 15-minute count of operations, each aircraft's time is first rounded down to the nearest 5 minutes. All aircraft having the same rounded time are aggregated into a 5-minute bucket. The number of aircraft contained in the first three time buckets (#1 through #3) is the first full 15-minute count. The second rolling 15-minute count is the number of aircraft contained in buckets #2 through #4. The remaining rolling 15-minute counts are determined by summing groups of three 5-minute buckets until the last bucket is counted in a rolling 15 minutes. The time coinciding with the last bucket in the largest rolling 15-minute count is identified as the peak 15-minute period.
- **Peak departure operations (rolling hour):** This is the number of departures that occur during the peak departure period as identified in a rolling-hour count of departures.
- **Peak arrival operations (rolling hour):** This is the number of arrivals that occur during the peak arrival period as identified in a rolling-hour count of arrivals.
- **Peak total operations (rolling hour):** This is the number of operations that occur during the operational peak period as identified in a rolling-hour count of all operations.
- **Peak departure operations (rolling 15-minute):** This is the number of departures that occur during the departure peak period as identified in a rolling 15-minute count of departures.
- **Peak arrival operations (rolling 15-minute):** This is the number of arrivals that occur during the arrival peak period as identified in a rolling 15-minute count of arrivals.
- **Peak total operations (rolling 15-minute):** This is the number of operations that occur during the operational peak period as identified in a rolling 15-minute count of all operations.
- **Delay:** Delay is the additional operating time attributed to any impediment to the free flow of aircraft through the system. Unimpeded travel time is the time it would take an aircraft to travel from Point A to Point B if it were the only aircraft in the system. Increases in the travel time from Point A to Point B as a result of interactions with other aircraft in the system are considered delays. Thus, total delay for any given aircraft is the difference between the actual time it takes the aircraft to get from Point A to Point B while interacting with other aircraft and the unimpeded time it would theoretically take the aircraft to get from Point A to Point B without other aircraft in the system.

  For statistical purposes, total delay was averaged across all aircraft moving through the system on the simulation day. Total delay is a combination of various key delay components, including departure gate delay, departure ground delay, arrival pre-departure ground delay, arrival ground delay, and arrival air delay, as defined:

  - **Departure gate delay:** For departing aircraft, this delay is the extra time incurred after the aircraft is ready to push back from the gate due to other ground traffic preventing the aircraft from moving.

  - **Arrival pre-departure ground delay**: For arriving aircraft, this delay is the extra time incurred on the ground at the origin airport due to sequencing at O'Hare. This delay is the result of sequencing actions taken by aircraft to ensure proper spacing on final approach to the arrival runways.
  - **Arrival ground delay:** For arriving aircraft, this is the total delay incurred between the time the flight touches down on the runway at O'Hare and the time it reaches the arrival gate. Arrival ground delay includes taxi-in delay, standoff delay, and runway crossing delay.
  - **Departure ground delay:** For departing aircraft, this is the total delay incurred between the time the flight completes its push back from the departure gate until it lifts off. Departure ground delay includes the sum of taxi-out delay, runway crossing delay, and runway queue delay.
  - **Arrival sequencing and vectoring air delay:** For arriving aircraft, this is the total airborne delay incurred due to holding, vectoring, and speed control within the sequencing boundary in the vicinity of O'Hare. This delay is the result of sequencing actions taken by aircraft to ensure proper spacing on final approach to the arrival runways.

- **Time in operational phase:** The average time in operational phase describes the operating time of aircraft in each phase of operation. The various components of total operating time include arrival airborne time, arrival ground time, departure airborne time, and departure ground time.

- **Arrival airborne time:** For arriving aircraft, this is the time from when the aircraft departs the origin airport to when the aircraft touches down at O'Hare. It includes any sequencing or vectoring delay encountered at O'Hare, as well as the unimpeded flying time between the origin airport and touchdown on a runway at O'Hare.

- **Arrival ground time:** For arriving aircraft, this is any time spent on the ground. It includes any delay imposed at the origin airport, rollout time after touching down on a runway at O'Hare, any ground delay (taxiing, runway crossing, or standoff [hold pad]) encountered at O'Hare, and unimpeded taxi time at O'Hare.

- **Departure airborne time:** For departing aircraft, this is the time from when the aircraft lifts off of a runway at O'Hare to when the aircraft arrives at the destination airport.

- **Departure ground time:** For departing aircraft, this is the time spent on the ground at O'Hare. It includes any gate delay imposed at O'Hare, any ground delay (taxiing, queuing, or runway crossing) encountered at O'Hare, the time it takes to push back from the gate, the unimpeded taxi time at O'Hare, and the takeoff roll time.

- **Arrival runway violations:** An arrival runway violation occurs when multiple aircraft occupy the same runway at the same time.

- **Average unimpeded travel time:** The unimpeded travel time describes the average operating time in each phase of operation. The various components of the operating phase include average

unimpeded airborne time and average unimpeded ground time. It does not include any delay. Average unimpeded travel time is heavily dependent on the city pairs that the DDFS utilizes in the simulation.

- **Average unimpeded airborne time:** Average unimpeded airborne time is the average time from when the aircraft departs to when the aircraft touches down on a runway at O'Hare. It does not include any delay. Average unimpeded airborne time is heavily dependent on the city pairs that the DDFS utilizes in the simulation.

- **Average unimpeded ground time:** Average unimpeded ground time is the average unimpeded time spent on the ground. It does not include any delay. For arriving aircraft, the average unimpeded ground time includes the time the aircraft touches down at O'Hare until the time the aircraft is at the gate. For departing aircraft, the average unimpeded ground time includes the time the aircraft begins pushing back until the time the aircraft ends its takeoff roll and becomes airborne.

2.3 TAAM Simulation Multi-Iteration and Annualized Results

Tables 2-1 through **2-28** provide the multi-iteration and annualized results for Experiments 911, 912, 913, 914, 915, and 916.

Table 2-8: Multi-Iteration Summary

This table contains averages over each experiment's multi-run. The "lumped" average delays and operational phase times were computed by adding times associated with all eleven iterations of the multi-run and dividing by the total of aircraft operations simulated in all eleven iterations. The peak operations shows are straight averages of the eleven iterations.

		Peak Operations (Rolling Hour)			Peak Operations (Rolling 15-Minute)			Average Delay per Phase of Operation (minutes per operation)					Average Delay Per All Airport Operations	Average Unimpeded Travel Times (minutes)						Average Time in Operational Phase (minutes)					
														Departures			Arrivals			Departures			Arrivals

ATTACHMENT D-4

TAP EA SIMULATION DATA PACKAGE – INTERIM PROPOSED ACTION

This attachment contains background material which supplements the TAAM material and data developed by the CDA. This material supports this EA and its Interim Proposed Action Alternative. Please note that when the TAAM simulations were developed, the No Action Alternatives were originally named No Project and the Proposed Action Alternatives were originally named With Project.

1. Background and General Operating Assumptions

1.1 Terminal Area Plan and Air Traffic Procedures Environmental Assessment

The O'Hare International Airport (O'Hare or the Airport) Modernization Program (OMP) was approved by the Federal Aviation Administration (FAA) in the 2005 O'Hare Modernization (OM) Environmental Impact Statement (EIS).[1] The OMP resulted in airfield capacity improvements that have been or are in the process of being completed, including construction and lengthening of several runways. The OMP also included additional terminal facilities at the Airport. However, by 2015 the conditions and needs for terminal infrastructure at O'Hare had evolved from those envisioned in the OMP due to airline mergers, formation of airline alliances, and development of international and domestic code-share partners. With these changes in mind, the Terminal Area Plan (TAP) will replace and/or update outdated/insufficient infrastructure and facilities in the terminal core, increase gate frontage,[2] and provide balanced opportunities for all airlines.

Similarly, some air traffic procedures for arriving and departing aircraft operating in the airspace around O'Hare and on the airfield have evolved since the approval of the OM EIS and 2015 Re-Evaluation. In addition, the FAA wishes to retain some existing procedures set to expire upon completion of the OMP runway reconfiguration to provide flexibility and maintain efficiency. These changes, collectively referred to as the Air Traffic Procedures (ATP), include:

- changes to the criteria for conducting land and hold short operations (LAHSO);
- development of consolidated wake turbulence separation standards; and
- retention of the Runway 10R-28L offset final approaches.

This Environmental Assessment (EA) is being conducted to assess the changes associated with the TAP and ATP. The following conditions were evaluated:

- With Project Full Build
- With Project Interim
- No Project Full Build
- No Project Interim

[1] The 2015 Re-Evaluation of the OM EIS assessed the effects from changes to the phased implementation of the OMP that were evaluated during the 2005 OM EIS.

[2] Gate frontage is the available length along terminal buildings that may be used for parking aircraft at individual gate positions.

This report summarizes the airfield, airspace, and other operating assumptions used as inputs for the simulation models for the With Project Interim condition. The simulation models were developed using Jeppesen's Total Airspace and Airport Modeler (TAAM), a fast-time delay and travel time computer simulation model that is used to calculate delay and travel times by simulating aircraft operations on the ground and in the air. The outputs from TAAM provided inputs for air quality, noise, and surface traffic analyses.

1.2 Overview of Simulation Process

The simulation modeling completed for the With Project Interim condition consisted of the following steps:

- Simulations from the With Project Full Build condition[3] were modified to reflect an anticipated airfield condition associated with the construction of the TAP. Modifications generally included:
  - removal of two Runway 9L-27R high-speed exit taxiways
  - modified taxiway geometry south of the Terminal 5 expansion
  - modified taxiway geometry and addition of a construction work area south and west of the Runway 4L threshold
  - addition of Terminal 2 and Concourses E and F
- Analyses of wind and weather data were conducted to determine the percent occurrence of major operating configurations and weather conditions, as well as to determine which of the operating configurations had high enough occurrences to model. The previous 10 full calendar years of weather data (2009 to 2018) were used for the analysis.[4]
- Based on FAA guidance, a 24-hour design day flight schedule (DDFS) was created and incorporated into the TAAM model. The DDFS includes 2,820 daily operations (arrivals and departures) and reflects an annual demand of 952,489 operations.

[3] The With Project Full Build simulation models were derived from the 2018 O'Hare Calibration, an iterative process of data collection/analysis, TAAM modeling, animation review, and simulation output metric analysis to verify the TAAM models reflect real-world operating conditions specific to O'Hare. The calibration effort included evaluation of runway throughput, runway usage, arrival taxi in times, departure taxi out times, standoff usage, and the percentage of day and night operations. The calibration effort produced four calibrated TAAM models to be used as the basis for the TAP and ATP EA. A summary of the calibration effort and resulting simulation assumptions is attached as **Appendix A**.

[4] Additional operating configurations are anticipated to be used at O'Hare that were not modeled as part of the TAP and ATP EA. The estimated annual occurrence of these operating configurations was not high enough to justify modeling.

- An experimental design, enumerating the combinations of operating configurations, weather conditions, and the aircraft activity levels to be modeled, was drafted, reviewed, and confirmed by the Air Traffic Workgroup.[5]
- Operating assumptions for each of the TAAM experiments were developed, reviewed, and refined by the Air Traffic Workgroup.
- Initial TAAM experiment models were developed by the simulation team for each of the experiments specified in the experimental design. The animations and output statistics for these models were reviewed by the Air Traffic Workgroup, which provided comments and refinements to the simulation team.
- Refined TAAM models were developed by the simulation team based on FAA direction and comments. These refined animations and output statistics were again reviewed, and additional comments and refinements were provided to the simulation team.
- When a particular TAAM experiment or set of TAAM experiments were refined to the simulation team and FAA's satisfaction, a memorandum was prepared by the FAA stating that the air traffic members of the Air Traffic Workgroup concurred with the assumptions used in the model(s) and that the experiments were a reasonable representation of how the airfield and airspace would operate under those conditions and, therefore, were acceptable for use in the TAP and ATP EA technical analyses.

1.3 Weather Conditions and Operating Configurations

Six operating configurations were identified by the Air Traffic Workgroup to be modeled for the TAP and ATP EA. Weather conditions (cloud ceiling height, visibility, wind velocity and direction, and precipitation) and airfield condition (dry or wet/contaminated pavement) determine the airfield and airspace operating procedures modeled for each operating configuration.

To establish weightings for the operating configurations modeled as part of the With Project Interim condition, weather data gathered from the National Centers for Environmental Information (NCEI) and airfield pavement condition data extracted from the Chicago Department of Aviation's (CDA) Electronic Logging System (ELS) were utilized to determine the percentage of the year each operating configuration could be used. Ten full years of data, from January 1, 2009, to December 31, 2018, were reviewed; 99.3 percent of the analyzed historical weather and airfield condition data fit within the criteria (wind, ceiling height, visibility, and airfield pavement condition) of the six modeled operating configurations.

[5] The Air Traffic Workgroup is comprised of representatives from the Airport's Air Traffic Control Tower (ATCT), Chicago Terminal Radar Approach Control (TRACON) facility (C90), Chicago ARTCC (ZAU), the National Air Traffic Controllers Association (NATCA), the FAA Central Service Center (AJV-C25), the FAA Airports Great Lakes Region (AGL-600), the FAA Chicago Airports District Office (ADO-CHI-600), the FAA's third-party contractor Harris Miller Miller & Hanson (HMMH), and Ricondo & Associates, Inc.

Table 1-1 shows the experiment number and annual weighting associated with each modeled operating configuration for the With Project Interim condition. The full weather analysis can be found in **Appendix B**.

TABLE 1-1: WEIGHTING FOR MODELED OPERATING CONFIGURATIONS

TAAM Experiment Number	Operating Configuration	Estimated Annual Occurrence of Modeled Operating Configurations
921	VFR West with LAHSO	37.7%
922	VFR West without LAHSO	14.5%
923	IFR West	4.3%
924	VFR East with LAHSO	24.3%
925	VFR East without LAHSO	16.1%
926	IFR East	3.1%
Total		100.0%

NOTES:

IFR – Instrument Flight Rules

VFR – Visual Flight Rules

LAHSO – Land and Hold Short Operations

TAAM – Total Airspace and Airport Modeler

PREPARED BY: Ricondo & Associates, Inc., September 2020.

1.4 Airfield Layout and Runway End Definition Data

Exhibits 1-1 and **1-2** illustrate the airfield layout and runway end points used for the With Project Interim condition TAAM models, respectively. The runway end coordinates and elevations utilized in TAAM and shown on Exhibit 1-2 were gathered from the *O'Hare International Airport Draft Future ALP*.

1.5 Design Day Flight Schedule, Gating, and Aircraft Parking

The DDFS prepared for the With Project Interim condition contains 2,820 total aircraft operations, representing an annual demand of 952,489 operations. Further information regarding forecast assumptions and DDFS development can be found in **Appendix C**.

1.5.1 Air Carrier Gating and Repositioning Analysis

A gating analysis was conducted to assign air carrier arrival and departure operations a terminal contact gate. Gate assignments considered factors such as gate allocation and gauge, aircraft turn times (time necessary to load and/or unload aircraft), and gate separation times (time between an aircraft departing a gate and a subsequent arrival at the gate). **Exhibits 1-3** and **1-4** illustrate the gate allocation and gauge and gate assignment ramp charts, respectively.

In addition, some arriving and departing operations were assigned repositioning movements. Repositioning movements are when air carrier aircraft that are not carrying passengers are moved between two gates or moved between a remote location and a gate. The simulated repositioning movements replicate additional aircraft activity that currently occurs at O'Hare and is anticipated to continue in the future.[6] **Exhibit 1-5** depicts the remote locations used for TAAM modeling.

For the With Project Interim condition, 222 repositioning movements, divided among three categories, were simulated:

- Remain Overnight (RON) Parking and Maintenance (98 movements)
  - Aircraft that arrive and are repositioned from the gate to a remote location for RON parking and/or to undergo maintenance; or
  - Aircraft that utilized RON parking and/or underwent maintenance at a remote location that are repositioned to a gate for departure.
- Gate Availability (72 movements)
  - Aircraft with long turn times that are repositioned to/from remote locations so that the gate can be used to accommodate other aircraft; or
  - Aircraft that arrive from foreign airports and unload passengers at Terminal 5 and are subsequently repositioned to Terminal 1, 2, or 3 for departure.
- Aircraft Switches and Maintenance (52 movements)
  - Aircraft that are repositioned to/from remote locations throughout the day to conduct in-depth servicing or maintenance.

1.5.2 Cargo and General Aviation Parking Areas

Exhibit 1-6 depicts the parking areas for general aviation (GA) and cargo operations.

[6] Members of the Air Traffic Workgroup and airline representatives met on August 23, 2019, to discuss existing and future repositioning activity. The topics discussed included the volume of repositioning movements, the remote locations aircraft are repositioned to/from during non-deicing season, and the methods used to reposition aircraft (aircraft taxiing under their own power or towed by aircraft tractors).
