1 Introduction

This technical report describes the noise modeling conducted for the Environmental Assessment (EA) for the Charlotte (CLT) Optimization of Airspace and Procedures in the Metroplex (CLT OAPM) project. The following sections describe the criteria used to identify potential noise impacts, the objectives in modeling noise for the EA for the CLT OAPM project, and the results of the noise analysis. Further information on the fundamentals of noise is provided in the EA (see **Appendix E, Basics of Noise**).

1.1 Noise Impact Criteria

The Federal Aviation Administration (FAA) has considered and identified threshold levels above which aircraft noise causes an adverse impact to people. The agency has determined that a significant impact occurs if a proposed action would result in an increase of Day-Night Average Sound Level¹ (DNL) 1.5 dB or higher on noise-sensitive areas exposed to DNL 65 dB or higher levels.

In 1992, the Federal Interagency Committee on Noise (FICON) recommended that noise increases of DNL 3 dB or higher in areas with exposure levels between DNL 60 and 65 dB be evaluated in environmental studies when increases of DNL 1.5 dB or higher occur at noise-sensitive locations with exposure levels at or above DNL 65 dB. Increases of this magnitude in areas with noise exposure levels below DNL 65 dB are not to be considered as “significant impacts,” but are reportable changes and receive further consideration. FICON’s recommendation has been adopted by FAA into FAA Order 1050.1E, Change 1, *Environmental Impacts: Policies and Procedures* (FAA Order 1050.1E).

In 1990, the FAA issued a noise screening procedure for determining whether certain airspace actions at or above 3,000 feet above ground level (AGL) might result in increases to DNL levels of 5 dB or higher. The noise screening procedure was issued in response to FAA experience that increases in noise of DNL 5 dB or higher at cumulative levels well below DNL 65 dB could be disturbing to people and become a source of public concern. In the Environmental Impact Statement (EIS) for the Expanded East Coast Plan (EECP), the FAA evaluated noise levels down to the DNL 45 dB level for potential increases in DNL noise exposure of 5 dB or higher. In the EECP study, the FAA determined that the DNL 45 dB level is the minimum level at which noise needed to be considered because “even distant ambient noise sources and natural sounds such as wind in trees can easily exceed this [DNL 45 dB] value.”² This threshold of change was subsequently used in the Chicago Terminal Airspace Project (CTAP) EIS and the Potomac Consolidated TRACON Airspace Redesign EIS. The FAA formalized the use of this threshold of change in the recent release of FAA Order 1050.1E.

For the purpose of this EA, increases of DNL 3 dB between DNL 60 and 65 dB and of DNL 5 dB between DNL 45 and 60 are considered as reportable changes when evaluating air

¹ The DNL metric represents noise as it occurs over a 24-hour period, with one important exception: DNL treats noise occurring at night differently from daytime noise. In determining DNL, the metric assumes that the A-weighted levels occurring at night (defined as 10 p.m. to 7 a.m.) are 10 dB louder than they actually are. This 10 dB increase is applied to account for the fact that there is a greater sensitivity to nighttime noise, and the fact that events at night are often perceived to be more intrusive because nighttime ambient noise is less than daytime ambient noise.

² U.S. Department of Transportation, Federal Aviation Administration, Expanded East Coast Plan – Changes in Aircraft Flight Patterns Over the State of New Jersey, Pp. 5-9. 1995.

traffic actions such as the Proposed Action. The increase in noise at these levels may be enough to be noticeable and potentially disturbing to some people, but the cumulative noise level is not high enough to constitute a “significant impact.” **Table 1** summarizes the criteria utilized to assess the level of change in noise exposure attributable to the CLT OAPM EA alternatives.

Table 1 Criteria for Determining Impact of Changes in Aircraft Noise

DNL Noise Exposure Level	Increase in DNL with Proposed Action	Aircraft Noise Exposure Change Consideration
DNL 65 and higher	DNL 1.5 dB or higher ^{1/}	Exceeds Threshold of Significance
DNL 60 to 65	DNL 3.0 dB or higher ^{2/}	Information Disclosed When Evaluating Air Traffic Actions
DNL 45 to 60	DNL 5.0 dB or greater ^{3/}	Information Disclosed When Evaluating Air Traffic Actions

2 CLT OAPM Noise Analysis Objectives

The CLT OAPM presents a detailed exercise in noise modeling for the following airports:

- Charlotte Douglas International Airport (CLT)
- Charlotte-Monroe Executive Airport (EQY)
- Concord Regional Airport (JQF)
- Donaldson Center Airport (GYH)
- Greenville Downtown Airport (GMU)
- Greenville Spartanburg International Airport (GSP)
- Piedmont Triad International Airport (GSO)
- Hickory Regional Airport (HKY)
- Rock Hill Airport-Bryant Field (UZA)
- Rowan County Airport (RUQ)
- Smith Reynolds Airport (INT)
- Spartanburg Downtown Memorial Airport (SPA)
- Statesville Regional Airport (SVH)

Because of the size of the General Study Area, and the number and variety of aircraft entering and exiting the General Study Area, more than 654,367 radar flight tracks were evaluated as part of the noise model input development.

The following sections describe the objectives identified to determine that the noise analysis provided a detailed and accurate assessment of noise exposure throughout the General Study Area.

2.1 Evaluate Changes in Noise Levels

The FAA has developed specific guidance and requirements for the assessment of aircraft noise in order to comply with National Environmental Policy Act (NEPA) requirements. This guidance, specified in FAA Order 1050.1E, requires that aircraft noise be analyzed in terms of the yearly DNL metric. In practice, this requirement means that DNL levels are computed for the Average Annual Day (AAD) of operations for the year of interest. The AAD represents all the aircraft operations for every day in a study year divided by 365, the number of days in a year. The AAD does not reflect a particular day, but is meant to represent a typical day over a period of a year.

Beyond requiring the use of the DNL metric, the FAA endorses the use of supplemental noise metrics on a case-by-case basis to describe aircraft noise impacts for specific noise sensitive locations. No supplemental noise metrics were calculated for the CLT OAPM EA.

The FAA requires that aircraft noise be evaluated using one of several authorized computer noise models. Specifically, for air traffic actions such as those proposed with the CLT OAPM project, the Noise Integrated Routing System (NIRS) model was used. See Section 3.1 for a detailed description of the NIRS model.

Noise exposure contours only describe noise impacts in the immediate vicinity of airports (three to five miles). The FAA's NIRS model provides a more detailed modeling tool to evaluate the effects of high-altitude airspace changes from the ground level up to 18,000 feet Above Ground Level (AGL) on noise-sensitive areas, and to determine whether more detailed analysis would be required. For this EA, a detailed analysis of current and future noise from aircraft operating between the surface and 10,000 feet AGL was conducted in the General Study Area.

The following scenarios were evaluated

1. 2011 Existing Conditions– routes as flown in the 2011 calendar year.
2. 2015 Future No Action– routes as forecasted to be flown in the year 2015 if no Proposed Action airspace changes are implemented.
3. 2015 Future Proposed Action– routes as forecasted to be flown in the year 2015 if the Proposed Action is implemented.
4. 2020 Future No Action– routes as forecasted to be flown in the year 2020 if no Proposed Action airspace changes are implemented.
5. 2020 Future Proposed Action– routes forecasted to be flown in the year 2020 if the Proposed Action is implemented.

The information disclosed in this study includes the maximum potential number of people exposed to DNL changes that meet or exceed the thresholds stated in **Table 1** for the scenarios previously listed.

2.2 Model all Traffic Routes over Entire General Study Area

As stated in Section 2, 654,367 radar flight tracks were used to evaluate and model typical flight routes and flows throughout the General Study Area. **Table 2** lists the 12 Study Airports and their associated runways that were included in the noise modeling. The set of radar flight tracks included all Instrument Flight Rules (IFR)³ flights that operated at or below 10,000 feet AGL in the General Study Area. Model flight tracks were developed directly from this radar data.

2.3 Model Day/Night Noise Levels at Population Centroids

Within the General Study Area, a total of 115,841 individual population grid points were evaluated, representing a total population of 6,029,387 people. These grid points, each of which represents a specific number of people, are referred to as population centroids. Each centroid represents a census block, the smallest geographical unit for which the U.S. Census maintains population data. The smallest centroid has a population of one, and the

³ Aircraft operate under two distinct categories of flight rules: Visual Flight Rules (VFR) and Instrument Flight Rules (IFR). These flight rules generally correspond with two categories of weather conditions: Visual Meteorological Conditions (VMC) and Instrument Meteorological Conditions (IMC). VMC generally exist during fair to good weather with good visibility. IMC occur during periods when visibility falls to less than three statute miles or the ceiling (the distance from the ground to the bottom layer of clouds when the clouds cover more than 50 percent of the sky) drops to lower than 1,000 feet. Under VFR, pilots are able to fly whatever route they chose and are responsible to "see and avoid" other aircraft and obstacles such as terrain to maintain safe separation. Under IFR ATC is responsible for providing separation from other aircraft and terrain and pilots use cockpit instruments and radar to fly routes specified by ATC and to comply with ATC instructions. Pilots must follow IFR during IMC; however, due to various factors such as the general requirement for aircraft to operate under IFR in Class A airspace (i.e., enroute airspace between 18,000 feet Mean Sea Level (MSL) and 60,000 feet MSL), the majority of commercial air traffic operates under IFR regardless of weather conditions.

largest centroid has a population of 2,510. Centroid locations and population counts were drawn by the U.S. Census Bureau based on 2010 U.S. Census data. For each of the five modeling scenarios, AAD DNL values for each scenario were calculated at all population centroids within the General Study Area.

2.4 Model Day/Night Noise Levels at Section 4(f) Resources and Historic and Cultural Resources in the General Study Area

An additional grid point analysis was performed to evaluate noise levels at sites or lands potentially protected under Section 4(f) of the Department of Transportation Act of 1966 (49 U.S.C. § 300 *et seq.*)(herein referred to as Section 4(f) properties or resources.) Section 4(f) resources include historic resources listed or eligible for listing on the National Register of Historic Places under the National Historic Preservation Act of 1966 (16 U.S.C. § 470) The Section 4(f) sites were initially identified as single point locations within the General Study Area. In some cases, the Section 4(f) properties covered a large area (usually large parks or wilderness areas) that were not well represented by a single analysis point. In these cases a uniformly spaced grid of points was defined over each area to provide adequate coverage.

2.5 Model all Traffic Routes in Areas between General Study Area Boundary and where aircraft operate at or below 18,000 feet AGL

Radar flight tracks were also used to evaluate and model flight routes in areas beyond the General Study Area boundary up to where IFR aircraft operate at or below 18,000 feet AGL. FAA Order JO 7400.2J, *Procedures for Handling Airspace Matters, Environmental Processing*; Chapter 32, Section 2 recommends the analysis of project related noise impacts in areas where IFR aircraft operate at 10,000 feet AGL to 18,000 feet AGL when a National Park or Wildlife Refuge is present.

2.6 Use Standard Procedure Profiles with Air Traffic Control Altitude Control Points

Aircraft within the Charlotte Metroplex operate in accordance with standardized air traffic control procedures. To model existing and proposed procedures, arrival and departure profiles were designed to meet certain altitude restrictions above 3,000 feet AGL as set by air traffic control, and to use standard procedure profile data provided by NIRS below 3,000 feet AGL.

2.7 Identify and Quantify Noise Changes and Causes Thereof

DNL levels were calculated for each centroid and grid point, differences in noise exposure between the Proposed Action and the No Action alternative for each of the future analysis years were quantified, and the causes of change in noise exposure were explained. The criteria set to meet this objective are described in Section 1.1, *Noise Impact Criteria*.

2.8 Produce Easily Interpreted and Informative Tables and Graphics to Report Results

The complexity (number of flight routes, airports, operations, etc.) of the study created challenges in reporting noise modeling results in a useful format for analysis. Tables and graphics were designed to provide data that would be understandable to the general public.

3 Noise Modeling and Analysis

The following sections describe the model used in the analysis, the data required for input into the model, noise model development procedures, and the outputs from the modeling process. Section 5.2.1 and Section 5.3.1 provide the modeling results and analysis of those results.

3.1 Noise Model

Prior to the development of NIRS, limited technology was available to examine noise impacts associated with high-altitude air traffic changes. The FAA-accepted methodology to examine high altitude noise impacts was published in FAA Notice 7210.360, *Noise Screening for Certain Air Traffic Actions Above 3,000 Feet AGL*, on September 14, 1990. The process outlined in this notice was subsequently converted to the Air Traffic Noise Screening (ATNS) computer model v.1.0 in 1995. This model was further revised to its current form as version 2.0 in early 1999. However, the ATNS noise screening program was limited in its application because it could examine only one route at a time. The FAA recognized that there was a need to evaluate multiple proposed high-altitude air traffic changes simultaneously, and also to evaluate changes in noise levels due to flights at or below 3,000 feet when more efficient arrival and departure procedures are proposed. Consequently, the FAA expended considerable time, effort, and expense in combining airspace design criteria and noise modeling technology to examine the cumulative effect of multiple route changes and their effect on noise levels over a large geographical area containing multiple airports. The end product was the NIRS model.

NIRS was initially developed in 1995 by the FAA Office of Environment and Energy (AEE-120), in cooperation with FAA's Air Traffic Environmental Programs Division (ATA-300), for assessing potential regional airspace design noise impacts. Its purpose is to assist the FAA in evaluating the environmental noise impacts of airspace routing and procedural alternatives designed to improve system safety and efficiency. It is specifically tailored to evaluate complex air traffic applications involving high-altitude routing (up to 18,000 feet AFE), broad area airspace changes affecting multiple airports, and other airspace modifications in the terminal and enroute environments that cannot be assessed using other methods, most notably the ATNS (ATNS-7210.360) and the INM. NIRS evaluates noise impacts by calculating DNL levels for specific locations on the ground, based on population centroids and grid points.⁴ NIRS Version 1.0 was released in June 1998 as a prototype model. The version of NIRS which was used for the CLT OAPM EA is NIRS Version 7.0b, Build 3, the latest version at the time the analysis was completed.

It must be noted that Aviation Environmental Design Tool (AEDT) has presently been adopted for regional airspace environmental analysis, and has recently subsumed NIRS functionality in being identified as the officially endorsed FAA tool for environmental modeling and analysis metrics (Noise, Fuel Burn and Emissions) output for regional airspace redesign/analysis projects. The CLT OAPM EA is grandfathered to use NIRS as are other projects that fall under the OAPM umbrella that were initiated prior to the official

⁴ U.S. Census Bureau, 2010 Census Data, U.S. Census Block Data, April 2010.

release of AEDT 2a on March, 21, 2012.⁵ Testing of AEDT relative to noise and fuel burn metrics have substantiated that the new tool provides environmental metrics output results that are in concert with results that are expected when using the NIRS tool for regional airspace redesign analysis projects. As reported by the FAA, "In 2014, AEDT 2b will also become the next generation aviation environmental consequence tool, further replacing the current public-use aviation air quality and noise analysis tools such as the INM (single airport noise analysis) and the Emissions and Dispersion Modeling System (EDMS – single airport emissions analysis)"⁶ as expanded capability of the AEDT tool from the regional airspace environmental analysis functionality in AEDT 2a is implemented.⁷

With respect to NIRS, the tool provides a powerful computational environment and graphical user interface, and provides the following major capabilities:

- Provides automated quantitative comparison of noise impacts across alternative airspace designs.
- Imports and displays track and operation data from airspace models, and population and community data from other sources.
- Enables users to specify air traffic control altitudes, and automatically calculates required aircraft thrusts and speeds necessary for noise using the same up-to-date database used for the INM.⁸
- Calculates predicted noise impacts at all population centroids (or other specially defined points) in large study areas.
- Provides automated means of annualizing noise impact based on different operational configurations and/or runway usage statistics.
- Identifies and maps all areas of change in noise impact.
- Identifies traffic elements that are the principal causes of change in noise impact in each area of change.
- Provides data for quantification of mitigation goals and identification of mitigation opportunities.
- Assembles tables and figures for noise-impact data analysis and report generation.
- Applies multiple layers of data checking and quality control.

⁵ U.S. Department of Transportation, Federal Aviation Administration, Order 1050.1E, Change 1, Guidance Memo #4: Date - March 21, 2012; Subject-Guidance on Using AEDT 2a to Conduct Environmental Modeling for FAA Air Traffic and Procedure Actions, (http://www.faa.gov/about/office_org/headquarters_offices/apl/enviro_n_policy_guidance/guidance/media/AEDT_Guidance_Memo.pdf).

⁶ U.S. Department of Transportation, Federal Aviation Administration, AEDT FAA Web Page, Second Paragraph; (http://www.faa.gov/about/office_org/headquarters_offices/apl/research/models/aedt/).

⁷ Per the AEE-400 memo dated March 21, 2012, "Guidance on Using AEDT 2a to Conduct Environmental Modeling for FAA Air Traffic Airspace and Procedure Actions," AEDT 2a replaces NIRS as the required model for aircraft noise, fuel burn and emissions modeling for FAA air traffic airspace and procedure actions. There is an exemption for projects whose environmental analysis began before March 1, 2012 hence the CLT OAPM EA used the latest version of NIRS.

⁸ NIRS v.7.0b utilizes the INM 7.0b version database.

NIRS was validated by the FAA's Office of Environment and Energy (AEE) against the INM tool in 1997. This process involved providing both models with identical inputs, and performing a detailed comparison of the resulting outputs for representative jet, turboprop, and propeller aircraft for both arrival and departure operations. The models were found to give the same results in terms of both final noise values and intermediate aircraft state parameters (position, altitude, thrust, and speed). An on-going program ensures the continued compatibility of the two models. Based on these results and on technical oversight of the NIRS development process, the FAA AEE approved the use of NIRS for evaluating airspace applications.

The NIRS noise assessment methodology, interpretation guidelines, and population-impact results have been briefed at several levels throughout the FAA and the U.S. Environmental Protection Agency (U.S. EPA). In addition, within the FAA, the Environmental Policy Team, within the Airspace Policy & ATC Procedures Group, Mission Support Services (AJV) and the AEE assure that model integrity is maintained in terms of noise standards and equations, consistency with airport methodology, and reliability of use. NIRS has historically been the best available tool to model noise exposure changes for a study of this magnitude and meet FAA's environmental responsibilities in an accurate and cost-effective manner until the recent release of the AEDT, as previously mentioned.

3.2 Input Requirements

Noise modeling requires several types of input data, including: airport/runway locations, operational levels, day/night distributions, fleet mix, runway usage, noise-power-distance relationships, climb/descent profiles, aircraft weights, flight tracks, track dispersion information, population and grid point locations, and boundaries of local jurisdictions. Details of the NIRS input data for the CLT OAPM project EA are discussed below.

3.2.1 Airport and Runway Data

Table 2 identifies the airports and runways modeled for this analysis. In total, 12 airports within the General Study Area were evaluated. All runways at these airports were assumed to be available for traffic assignments in NIRS.

Table 2 Charlotte Metroplex EA Study Airports

Airport Name	Code	Location	Runways ^{1/}
Charlotte Douglas International Airport	CLT	Charlotte, North Carolina	05, 23, 18L, 18R, 18C, 36L, 36R, 36C
Charlotte-Monroe Executive Airport	EQY	Monroe, North Carolina	05, 23
Concord Regional Airport	JQF	Concord, North Carolina	02, 20
Donaldson Center Airport	GYH	Greenville, South Carolina	05, 23
Greenville Downtown Airport	GMU	Greenville, South Carolina	01, 19, 10, 28

Hickory Regional Airport	HKY	Hickory, North Carolina	01, 10, 06, 24
Piedmont Triad International Airport	GSO	Greensboro, North Carolina	14, 32, 05L, 05R, 23R, 23L
Rock Hill Airport-Bryant Field	UZA	Rock Hill, South Carolina	02, 20
Rowan County Airport	RUQ	Salisbury, North Carolina	02, 20
Smith Reynolds Airport	INT	Winston Salem, North Carolina	04, 22, 15, 33
Spartanburg Downtown Memorial Airport	SPA	Spartanburg, South Carolina	05, 23
Statesville Regional Airport	SVH	Statesville, North Carolina	10, 28

Notes:

1/

A runway can be used in both directions, but is named in each direction separately. Runway number is based on the magnetic direction of the runway (e.g., Runway 09 points to the east direction). The two numbers on either side always differ by 180 degrees. If there is more than one runway pointing in the same direction, each runway number includes an 'L', 'C' or 'R' at the end. This is based on which side a runway is next to another one in the same direction.

3.2.2 Local Environmental Variables

To calculate noise levels specific to the conditions in the General Study Area, the NIRS model uses several local environmental variables. These include temperature, atmospheric pressure, humidity, airport average headwind, airport elevation, and terrain. For this analysis, forty years (1973 - 2012) of daily weather observations collected at CLT airport were used to determine the long-term average weather conditions in the General Study Area.

Table 3 summarizes the weather data used for the NIRS analysis.

Table 3 Environmental Variables – Weather

Variable	Annual Average
Temperature (F)	60.7
Barometric Pressure (in-Hg)	30.07
Relative Humidity (%)	66.8

Source: National Climatic Data Center, National Oceanic and Atmospheric Administration (<http://www.ncdc.noaa.gov>), September 2013, ATAC Corporation, September 2014.

Prepared by: ATAC Corporation, September 2014.

The airport elevation for Concord Regional Airport (JQF) at 639.9 feet above mean sea level (MSL) was selected as the NIRS study elevation for the analysis. Detailed terrain data for the entire General Study Area was incorporated from the United States Geological Survey (USGS) 1-degree Digital Elevation Model (DEM) database for the United States.⁹ This database provides elevation data at ground points separated by three arc-seconds (approximately 75 m east-west and 75 m north-south in the area). The elevation values for each point are provided at a 1-meter resolution.

3.2.3 Operation Levels and Day/Night Distribution

IFR operation levels for each Study Airport were based on radar data and Aviation Activity Forecasts developed for this analysis. The forecasts are presented in a separate technical report, available via the project website or upon request. The information contained in these forecasts, which is necessary for noise modeling, includes the type of aircraft, origin and destination airport, daytime or nighttime operation time, and the average number of daily operations. The detailed operation tables which comprise the forecast were developed for the forecast years 2015 and 2020. For this analysis, each forecast represents the average day (annual/365) of traffic for the year of interest. **Table 4** presents the IFR operation totals modeled for the CLT OAPM EA.

⁹ U.S. Department of the Interior, U.S. Geological Survey, National Elevation Dataset, (<http://ned.usgs.gov/>).

3.2.4 Runway Use

Generally, the primary factors determining runway use at an airport are the weather and prevailing wind conditions at the time of a flight. Additionally, several key secondary factors also have a strong influence on runway selection. These factors include runway safety issues (taxiing aircraft crossing active runways or Land and Hold Short-LAHSO rules), the current composition of the traffic (many arrivals or many departures), and even the flight origin or destination. This latter factor is also based on safety from the standpoint that traffic is easier to sort on the ground (taxi for direction) than it is in the air.

Typically, arriving and departing aircraft are assigned to a specific fix. These fixes, in turn, may have a preferred arrival or departure runway assignment and a secondary arrival or departure runway assignment. As controllers attempt to balance delay and runway utilization by time of delay based on the demand, there are times when arriving and departing aircraft are diverted to a secondary runway. This is especially true when an airport has multiple parallel runways. This allows the airfield to operate in the most efficient and safest manner.

It is important to note that within the context of all of these factors, the future runway use at an airport is, at best, an estimate. Simple changes over time such as airlines changing the markets (destinations) that they serve can have a notable effect on actual runway use in the future.

Table 5 presents the airport runway operating configuration usage based on analysis of 2011 radar data (note runway arrival/ departure detail by configuration in **Table 5**.) The runway operating configuration refers to the direction a runway is used for arrivals and departures, which can vary based on the direction of prevailing winds. For the CLT OAPM

Study Airports, the runway use for the future conditions was developed primarily based on analysis of the available archived radar data which was accurate enough to determine runway use based on operation type, aircraft category, time of day, and origin/destination. The radar sample archive which met these criteria was collected between January 1, 2011 and December 31, 2011. The runway operating configuration usage remains the same for 2015 and 2020 as for 2011.

Table 5 Runway Operating Configuration Usage CLT (2011, 2015, and 2020)

2011				
Operating Configuration	Arrival Runways	Departure Runways	Day	Night
CLT				
North	36L, 36C, 36R, 05	36L, 36C, 36R, 05	31.2%	25.4%
South	18L, 18C, 18R, 23	18L, 18C, 18R, 23	68.8%	50.3%
Night	05, 23	05, 23	0.00%	24.25%
2015				
Operating Configuration	Arrival Runways	Departure Runways	Day	Night
CLT				
North	36L, 36C, 36R, 05	36L, 36C, 36R, 05	31.2%	27.7%
South	18L, 18C, 18R, 23	18L, 18C, 18R, 23	68.8%	54.8%
Night	05, 23	05, 23	0.0%	17.5%
2020				
Operating Configuration	Arrival Runways	Departure Runways	Day	Night
CLT				
North	36L, 36C, 36R, 05	36L, 36C, 36R, 05	31.2%	27.7%
South	18L, 18C, 18R, 23	18L, 18C, 18R, 23	68.8%	54.8%
Night	05, 23	05, 23	0.0%	17.5%

Notes:

1\ North Flow corresponds with North Flow at the other study airports.

2\ South Flow corresponds with South Flow at the other study airports.

Source: U.S. Department of Transportation, Federal Aviation Administration, FAA Airport Diagrams [http://www.faa.gov/airports/runway_safety/diagrams/], Accessed September 2014, PDARS Data (2011, 2012), ATAC Corporation, September 2014.

Prepared by: ATAC Corporation, September 2014.

Tables 6 through 17 present summaries of the modeled airport runway use percentages for Study Airport arrivals and departures respectively by daytime and nighttime for the No Action and Proposed Action. While overall city pair factors for flights that are forecasted to evolve over time based on the forecasts are used to determine airspace fix assignment and airspace fix locations for the No Action Alternative and Proposed Action Alternative. Air traffic procedure optimization design criteria were used for the runway distribution of individual annualized operations at the Study Airports. This was done based on optimizing

ATC flows with moderate changes to runway use based on runway operating configuration. The proposed air traffic procedures do not change runway use; therefore, the distribution of operations was held constant between No Action and Proposed Action.

As shown in **Table 5**, the average annual runway operating configuration use for the Study Airports under 2011, 2015, and 2020 conditions, reflects average runway usage as sampled over 362 days in 2011 from January 1, 2011 through December 31, 2011 providing a representative statistical sampling of existing conditions runway usage.¹⁰ The remaining three days of data for 2011 was either unavailable due to radar equipment anomalies, operational outages, or extreme weather events that made the data unreliable. The average annual runway use for the Study Airports as presented in **Tables 6** through **18** for the 2015 and 2020 No Action scenarios, which is based on historical runway use over a period from January 1, 2011 through December 31, 2011. The average annual runway use for 2015 and 2020 Proposed Action is based on estimates provided by air traffic controllers associated with anticipated changes in airport runway operating configuration use with the new procedures in place. As depicted in the tables, runway use is not notably different between No Action and Proposed Action. Note that differences in configuration use between those used in this study and other studies may result given the use of different time periods to derive the No Action configuration use and as a result, assumptions about future configuration use.

¹⁰ See CLT OAPM Draft EA Chapter 4, Section 4.3.1.1 Noise Modeling Methodology.

3.2.5 Aircraft Fleet Mix

Fleet mix assumptions were developed for the CLT OAPM EA as part of the forecasting effort. **Tables 19** through **26** presents the forecasted NIRS model fleet mixes for 2015 and 2020 for operations at the Study Airports for both the No Action and Proposed Action alternatives. The tables present the aircraft types as used in the NIRS model. Not all specific aircraft types that were present in the forecast are available aircraft types in the NIRS model. For those cases, FAA-approved substitutions provided in NIRS were chosen. Those not listed in NIRS as approved substitutions, a proposed NIRS aircraft type based on similar operating and noise characteristics was chosen and approved by FAA. The letter to the FAA requesting approval of these substitutions and the response from the FAA is included with this technical report as **Appendix 1**. There are no differences between the fleet mixes of the No Action and Proposed Action alternatives for a given model year (2015 or 2020).

Notes:

Totals may not add up to 100% due to rounding.

Heavy Jets = Aircraft capable of takeoff weights of 300,000 pounds or more whether or not they are operating at this weight during a particular phase of flight. (FAA Order JO71110.65U, Air Traffic Control, Appendix A.)

Jets = Aircraft of more than 41,000 pounds, maximum certificated takeoff weight, up to but not including 300,000 pounds. (FAA Order JO71110.65U, Air Traffic Control, Appendix A.)

Small Jets = Aircraft of 41,000 pounds or less maximum certificated takeoff weight. (FAA Order JO71110.65U, Air Traffic Control, Appendix A.)

Turboprops = Aircraft powered by turboprop engines.

Props = Propeller driven aircraft

Notes:

Totals may not add up to 100% due to rounding.

Heavy Jets = Aircraft capable of takeoff weights of 300,000 pounds or more whether or not they are operating at this weight during a particular phase of flight. (FAA Order JO71110.65U, Air Traffic Control, Appendix A.)

Jets = Aircraft of more than 41,000 pounds, maximum certificated takeoff weight, up to but not including 300,000 pounds. (FAA Order JO71110.65U, Air Traffic Control, Appendix A.)

Small Jets = Aircraft of 41,000 pounds or less maximum certificated takeoff weight. (FAA Order JO71110.65U, Air Traffic Control, Appendix A.)

Turboprops = Aircraft powered by turboprop engines.

Props = Propeller driven aircraft

Notes:

Totals may not add up to 100% due to rounding.

Heavy Jets = Aircraft capable of takeoff weights of 300,000 pounds or more whether or not they are operating at this weight during a particular phase of flight. (FAA Order JO71110.65U, Air Traffic Control, Appendix A.)

Jets = Aircraft of more than 41,000 pounds, maximum certificated takeoff weight, up to but not including 300,000 pounds. (FAA Order JO71110.65U, Air Traffic Control, Appendix A.)

Small Jets = Aircraft of 41,000 pounds or less maximum certificated takeoff weight. (FAA Order JO71110.65U, Air Traffic Control, Appendix A.)

Turboprops = Aircraft powered by turboprop engines.

Props = Propeller driven aircraft

Notes:

Totals may not add up to 100% due to rounding.

Heavy Jets = Aircraft capable of takeoff weights of 300,000 pounds or more whether or not they are operating at this weight during a particular phase of flight. (FAA Order JO71110.65U, Air Traffic Control, Appendix A.)

Jets = Aircraft of more than 41,000 pounds, maximum certificated takeoff weight, up to but not including 300,000 pounds. (FAA Order JO71110.65U, Air Traffic Control, Appendix A.)

Small Jets = Aircraft of 41,000 pounds or less maximum certificated takeoff weight. (FAA Order JO71110.65U, Air Traffic Control, Appendix A.)

Turboprops = Aircraft powered by turboprop engines.

Props = Propeller driven aircraft

3.2.6 Aircraft Noise-Power-Distance (NPD) Curves

NIRS uses tables of sound exposure levels for specific aircraft and associated engines that determine how the sound level varies with the power setting of the engines and with the distance from the engine to the observer on the ground. These tables are termed noise-power distance (NPD) curves. The NPD curves developed by the FAA for Release 7.0b.3 of NIRS were used in this analysis.

The NPD curves are accessed during NIRS noise calculations to determine the noise levels at each population and grid location. The contribution of each operation assigned to every flight track is calculated for every location depending on the power setting for each flight segment in each track, and upon the distance to the aircraft on each segment. The total noise exposure at each location is determined by aggregating the effects across all operations.^{11,12}

3.2.7 Aircraft Climb/Descent Profiles

To accurately model noise exposure, NIRS has the capability to include specified altitude restrictions incorporated in the flight track and operations data. The modeled aircraft trajectory in NIRS will reflect altitude information provided by the air traffic procedure design, rather than following a standard procedure profile, as is ordinarily done in INM studies. NIRS automatically generates profiles for each aircraft operation on each flight track that are consistent both with the specified altitudes and the NIRS aircraft-performance database.

The altitude-following capability is only applied above altitudes of 3,000 feet Above Field Elevation (AFE).¹³ This means that for all flight tracks that the NIRS standard procedure profile will be used up to 3,000 feet AFE. Above 3,000 feet AFE, the profile will follow the specified air traffic procedure altitude controls design. Four types of altitude control have been encoded in the input files as follows: (1) no altitude control; (2) fly to a specified altitude or higher; (3) fly to a specified altitude; and (4) fly to a specified altitude or lower.

All routes are checked for violations of general profile constraints, such as maximum climb and descent angles. If necessary, the route is flagged for further modification to remedy such violations.

Once each profile meets all constraints, thrust is calculated according to whether the aircraft is climbing or descending along different parts of the route. NIRS climb calculations use maximum climb thrust from 10,000 feet to 18,000 feet AFE for continuous or uninterrupted climbs. If there are level segments, NIRS will apply the appropriate thrust levels during the level segment, then apply maximum climb thrust at the point where the climb continues. NIRS descent calculations use a straight-line geometric descent from higher altitudes (i.e., above 6,000 feet AFE) as specified in the air traffic control design. If there is a level segment, NIRS will apply the appropriate thrust level while the aircraft is on it. Below

¹¹ U.S. Department of Transportation, Federal Aviation Administration, *NIRS User's Guide, Version 7.0b.2*, February 2012.

¹² U.S. Department of Transportation, Federal Aviation Administration, *INM Technical Manual, Version 7.0.*, January 2008.

¹³ U.S. Department of Transportation, Federal Aviation Administration, FAA Notice 7210.360, *Noise Screening Procedures for Certain Air Traffic Actions Above 3,000 Feet AGL*, September 14, 1990

10,000 feet AFE for departures and below 6,000 feet AFE for arrivals, NIRS uses the appropriate thrust and aircraft configurations available in the NIRS database required to fly the profile specified in the air traffic procedure design. For more information related to available aircraft operating configuration and thrust options, refer to the NIRS User Manual.¹⁴

Routes that have no altitudes higher than 3,000 feet AFE are treated as special “low altitude route” cases. They are processed as follows:

- **Procedure 1** - The highest altitude on a particular flight track is identified.
- **Procedure 2** - For departures, the standard-procedure profile is used until reaching the track distance associated with that highest altitude. Altitude controls after that point are followed in order to maintain the subsequent ascent.
- **Procedure 3** - For arrivals, altitude controls prior to the track distance associated with the highest altitude are followed (in order to maintain an initial descent, for example). The standard procedure profile is followed from the highest altitude to the runway.

For the CLT OAPM EA, there were 12 routes that stayed at or were lower than 3,000 feet AFE.

3.2.8 Aircraft Stage Length

Stage length is the term used in NIRS to refer to the length of the trip planned for each departure operation from origin to destination. The trip length is needed in noise calculations because it influences the take-off weight of the aircraft, which is higher for longer trips, and lower for shorter trips. The great-circle distance is used to calculate a stage length for each aircraft operation. For purposes of this noise analysis, arrival and departure airport pairs were input into the NIRS model, which automatically assigned the appropriate stage length.

3.2.9 Flight Track Definitions

To determine projected noise levels on the ground, it is necessary to determine not only how many aircraft are present, but also where they fly. Therefore, flight route information is a key element of the NIRS input data. In order to ensure that the NIRS modeling accurately reflects local conditions in the Charlotte Metroplex it is necessary to develop noise modeling tracks from a sample of detailed radar data. A radar sample of 362 days between January 1, 2011 and December 31, 2011 was acquired and analyzed for operations encompassing the CLT OAPM EA Study Airports. This detailed information allowed for the development of a sufficiently rigorous database of flight tracks for the noise modeling effort representing AAD conditions.

Proprietary software was utilized for the detailed analysis of radar data for each CLT OAPM EA Study Airport. The data was separated first by airport and operation type (i.e. arrival, departure). Spatial analysis via proprietary software was conducted to develop bundles (a grouping of tracks representing a traffic flow) of radar tracks based on runway, aircraft category (i.e. jet, prop), and route similarity. The radar bundling process also included a

¹⁴ U.S. Department of Transportation, Federal Aviation Administration, Noise Integrated Routing System User's Guide Version 7.0b.2, February 2012.

review of the 3-dimensional aspect of each group of radar tracks. Bundles were split as necessary to isolate groups of tracks with restricted climb or descent profiles. Such groups generally represent flights operating along specific ATC climb or descent procedures or via ATC instructions. Once the radar track bundles were complete, the development of noise modeling input tracks was initiated.

Automated special analysis calculations were applied to the bundles to calculate primary, or backbone, flight tracks for each radar track bundle. The proprietary software also allows for the simultaneous computation of sub-tracks that are located adjacent to the backbone track. These sub-tracks account for the dispersion of actual flights about the primary flight corridor based on the distribution of radar tracks within each bundle. The spatial analysis process computes the appropriate number of sub-tracks and distributional factors in combination with the statistical lateral distribution of the radar tracks at many locations along the flight corridor to determine the appropriate spacing between the sub-tracks at each location. The number of sub-tracks and the distributional factor associated with each model track are chosen based on the number of radar tracks in the bundle and their general spread throughout the traffic flow.

The radar data analysis resulted in the development of 11,308 unique departure tracks or NIRS model input (backbones and sub-tracks). **Exhibit 1** presents an overview of the Charlotte Metroplex NIRS departure tracks used in the modeling of 2011 Existing Conditions. The analysis also resulted in the development of 11,688 unique arrival tracks that were developed for NIRS model input (backbones and sub-tracks). **Exhibit 2** presents the resulting Charlotte Metroplex NIRS arrival tracks used in the modeling of 2011 Existing Conditions.

THIS PAGE INTENTIONALLY LEFT BLANK

For the most part, the routing for No Action airspace procedures in 2015 and 2020 is anticipated to be exactly the same as for 2011 Existing Conditions, excluding the addition of previously developed procedures identified as having independent utility and were separately analyzed for environmental effects (see Table 5-13, Past, Present, and Reasonably Foreseeable Future Actions in Section 5.11 of the EA.) In this light, the model backbones and sub-tracks created from current condition radar data including these procedures and were used directly in the modeling of No Action scenarios.

3.2.10 Flight Track Assignments

The final step in developing the flight track input data for the NIRS model is the assignment of aircraft to specific flight tracks. The radar data sample acquired for the flight track analysis was used as a basis for this analysis. The flight data associated with the bundle of radar data used to make the NIRS backbone track was retained as an attribute of each backbone track. This data included aircraft type, time-of-day (day or night), and flight origin or destination.

The flights at each Study Airport modeled for 2015 and 2020 were provided as part of the forecasts. These forecasts included aircraft type, time-of-day, and origin/destination data. Each of the flights in the design-day schedule was parsed into fractions of operations assigned to a specific runway based on the aforementioned runway use percentages. Once parsed by runway, the flights were then further parsed to each NIRS backbone based on the proportion of radar tracks that match the aircraft category (jet, turboprop, prop), time-of-day (day or night) and the airspace fix predominately used by the origin/destination of the scheduled flight. Thus the weighting of the flight tracks and routes was closely tied to the real-world radar data from the Charlotte Metroplex area. The process of track assignments continued until all forecasted operations for each Study Airport had been assigned. Once assigned to a specific backbone, the operations are further parsed to make the proportional assignments to the sub tracks associated with each backbone.

3.2.11 Population Data

Population locations were extracted from 2010 U.S. Census data for the entire General Study Area. The Census data were incorporated into the analysis using census blocks, the smallest area within the Census database that includes defined population data. Geographically, census blocks vary in size but tend to represent city blocks in urban areas and larger areas in rural regions. Each census block includes a centralized point known as a centroid which was used for noise computation. Of the 115,841 census block centroids identified in the General Study Area, 58,294 were devoid of population and excluded from the analysis. **Exhibit 3** depicts the General Study Area and extracted population centroids.

4 Noise Modeling Procedures

NIRS processes flight-track and operation data following several major steps: data integration and quality control, calculation of flight dynamics (i.e., thrust and speed), noise exposure computation, annualization of noise exposures, change of exposure analysis, and report generation. Key aspects of this process are discussed below.

4.1 Model Input

The input for the NIRS modeling effort was developed in accordance with the data, sources, and methodologies presented in the previous sections. The input representing the AAD of operations for the No Action Alternative was fed to the NIRS model unchanged from the results described in the earlier sections. The input files for the Proposed Action and No Action Alternative vary due to the differences in procedures under each alternative.

4.2 Data Integrity Checks

Before noise calculations are carried out, the NIRS pre-processor is run on all data components that contribute to noise for a given annualized scenario. The resulting operation counts are checked against expected counts, and modeled fleet mix tables are reviewed for consistency with the noise modeling assumptions. Profiles and operations were checked during the same pre-noise calculations, and profiles that violate the following rules were flagged:

<u>Flag Type</u>	<u>Rule</u>
Climb/Descent	No angles greater than 30 degrees
Altitude Controls	There must be at least one altitude set above ground level
Aircraft	There must be an INM profile aircraft type
Runways	Assigned runways must be longer than aircraft takeoff distance

Track/aircraft combinations with flagged profiles are rejected by NIRS prior to noise calculations. Elements of the input data that failed the above tests or that were not readable due to format errors were reviewed and modified.

4.3 Develop Output Reports for Impact Analysis

After all noise calculations are complete, NIRS is used to determine noise impacts by locating and categorizing changes in noise values between scenarios. Using FAA scoring criteria (significant impact and reportable noise change thresholds described in Section 1.1, *Noise Impact Criteria*), maps depicting zones of various types of change in annualized DNL noise exposure between scenarios are typically produced within NIRS for the entire General Study Area.

The FAA scoring criteria is used to compare DNL changes at the population centroids and grid points in the General Study Area. For each scenario, all population is divided into three categories: (1) those receiving an increase at or above a threshold in noise exposure relative to the baseline (No Action); (2) those receiving a decrease at or below a threshold; and (3) those having no changes that exceed the thresholds.

THIS PAGE INTENTIONALLY LEFT BLANK

5 NIRS Analysis

A NIRS model analysis was conducted for each of the five scenarios outlined in Section 2.1. Noise impact results were tabulated based on the potential implementation of the Proposed Action compared to the No Action Alternative at the previously described population centroids and supplemental grid points.

The following sections present both a summary of the NIRS input modifications made to model the Proposed Action and the results of the noise analysis for each scenario.

5.1 Existing Conditions and No Action Conditions

The existing conditions for 2011 and the No Action conditions for 2015 and 2020 were modeled in NIRS. For the purposes of this study, the 2015 and 2020 No Action conditions vary slightly from 2011 aircraft flight trajectories in that of the 32 procedures included under this alternative, 21 are modified air traffic actions that were implemented after 2011. The 21 procedures include nine Standard Terminal Arrival procedures (ADENA THREE, HUSTN TWO, IVANE FOUR, JOHNS THREE, SUDSY FOUR, UNARM THREE, UNMAN TWO, WHTTL TWO, and BROOK THREE) and 12 Standard Instrument Departures (ANDYS SEVEN, BOBCAT FIVE, BUCKL SEVEN, DEBIE SEVEN, HORNET SEVEN, HUGO TWO, JACAL SIX, LILLS SIX, MERIL SIX, PANTHER TWO, ZAVER THREE, and TRIAD SIX). These procedures became part of the No Action baseline for both 2015 and 2020, and are considered as existing procedures when analyzed against the OAPM procedures being assessed as part of this EA. The 21 airspace procedures were previously evaluated through separate environmental analysis documentation.

5.2 No Action Noise Model Input

For the No Action conditions the NIRS input was directly based on the radar data analysis presented in previous sections and adjusted for interim changing conditions. These changing conditions include adjustments made to runways at UZA as a part of runway safety area improvement project, as well as inclusion of the 21 independent utility procedures discussed in Section 5.1.

Procedures for the optimization of arrivals and departures for the various runway operating configurations that would be in use in 2015 and 2020 were based on input from the CLT OAPM Design & Implementation Team (D&I Team). Input from the CLT OAPM D&I Team indicated that runway operating configuration use and specific runway use is not expected to change from that employed in 2011. Excluding 2015 and 2020 operational levels, fleet mix, and city-pairs, the model input for both years remained the same.

5.3 Proposed Action Model Input

The Proposed Action consists of several air traffic procedure modifications as discussed in the EA, Chapter 3, *Alternatives*. Those modifications were implemented in the noise modeling through adjustments to the flight track routing at the Study Airports, or developed in NIRS as new tracks. The flight track adjustments are further discussed in the following sections. Because the Proposed Action does not involve changes that are considered capacity enhancements or any actions that would induce growth in operations, operation levels, fleet mix and day/night distribution input was the same as for No Action for both 2015

and 2020. Environmental variables (i.e., temperature, humidity, barometric pressure, and headwind) were the same among Existing Conditions, No Action and Proposed Action. The following sections describe changes related to the NIRS tracks developed for the Proposed Action.

Study Airports - Arrivals

Exhibit 4 compares the routing flow differentials between the Proposed Action (top) and No Action (bottom) for arrivals to the Study Airports under North flow conditions. Similarly, **Exhibit 5** depicts the routing flow differentials between the Proposed Action (top) and No Action (bottom) for arrivals to the Study Airports under South flow conditions. (No Action arrival corridors are depicted in Exhibits 3-6 and 3-7 in Section 3.2.1 of the EA and Proposed Action arrival corridors are depicted in Exhibits 3-8 and 3-9 in Section 3.2.2 of the EA.) The Proposed Action changes constitute a general trend away from radar vector operational ATC procedures for portions of the arrival trajectory and towards increased use of Area Navigation (RNAV) Standard Terminal Arrival (STAR) procedures. This represents a greater use of standardized procedures that increase routing predictability, flexibility and traffic segregation. The changes between Proposed Action and No Action routing for NIRS arrival tracks to the Study Airports are shown on **Exhibit 6**. Proposed Action routes are depicted in orange, and No Action routes are depicted in purple.

The proposed action corridors are changes to procedures (and new procedures) that largely de-conflict procedures in close proximity to one another, proceduralize the existing radar tracks (what is currently done today), and reduce the number and length of level –offs aircraft must fly while on the routes. Because many of the existing routes conflicted with one another, aircraft were often taken off the existing route and vectored for their arrival/departure at the study airports. The new routes are largely RNAV (GPS based) procedures that allow for greater control of aircraft in the airspace.

Study Airports – Departures

Exhibit 7 compares the routing flow differentials between the Proposed Action (top) and No Action (bottom) for departures to the Study Airports under North flow conditions. Similarly, **Exhibit 8** depicts the routing flow differentials between the Proposed Action (top) and No Action (bottom) for arrivals to the Study Airports under South flow conditions. (No Action arrival corridors are depicted in Exhibits 3-6 and 3-7 in Section 3.2.1 of the EA and Proposed Action arrival corridors are depicted in Exhibits 3-8 and 3-9 in Section 3.2.2 of the EA.)

Exhibit 9 compares the routing flow differentials between the Proposed Action and No action departures for the study airports.

5.4 Proposed Action and No Action Impact Analysis Results

Table 27 presents the results of the noise change analysis under the Proposed Action for 2015 conditions. The analysis indicates that the Proposed Action would not result in a DNL 1.5 dB increase in areas exposed to DNL of 65 dB and higher, nor would it result in a reportable noise increase of DNL 3.0 dB in areas exposed to DNL 60 dB to 65 dB. Additionally, the Proposed Action would not result in a reportable noise increase of DNL 5.0 dB in areas exposed to DNL 45 dB to 60 dB.

Table 27 Change in Potential Population Exposed to Aircraft Noise - 2015

DNL Noise Exposure Level Under the Proposed Action	Increase in DNL with the Proposed Action	Population Exposed to Noise that Exceeds the Threshold
DNL 65 dB and higher	DNL 1.5 dB or greater	0
DNL 60 dB to 65 dB	DNL 3.0 dB or greater	0
DNL 45 dB to 60 dB	DNL 5.0 dB or greater	0

Source: 2010 U.S. Census (population centroid data), October 2014; ATAC Corporation, October 2014 (NIRS modeling results).

Prepared By: ATAC Corporation, October 2014.

Table 28 presents the results of the noise change analysis under the Proposed Action for 2020 conditions. The analysis indicates that the Proposed Action would not result in a DNL 1.5 dB increase in areas exposed to DNL of 65 dB and higher, nor would it result in a reportable noise increase of DNL 3.0 dB in areas exposed to DNL 60 dB to 65 dB. Additionally, the Proposed Action would not result in a reportable noise increase of DNL 5.0 dB in areas exposed to DNL 45 dB to 60 dB.

Table 28 Change in Potential Population Exposed to Aircraft Noise - 2020

DNL Noise Exposure Level Under the Proposed Action	Increase in DNL with the Proposed Action	Population Exposed to Noise that Exceeds the Threshold
DNL 65 and higher	DNL 1.5 dB or greater	0
DNL 60 to 65	DNL 3.0 dB or greater	0
DNL 45 to 60	DNL 5.0 dB or greater	0

College Park, GA 30337
Kristi.Ashley@faa.gov

Subject: NIRS Aircraft Substitution Request
Reference: Charlotte OAPM Environmental Assessment
Contract No.: Contract DTFAWA-11-D-00019
Task Order No.: 0014

Dear Ms. Ashley:

As part of the various Optimization of Airspace and Procedures in the Metroplex (OAPM) Environmental Assessments (EA), ATAC is developing the inputs for the Noise Integrated Routing System (NIRS). The NIRS will be used to model the noise effects resulting from proposed changes to the airspace. Consistent with Federal Aviation Administration (FAA) policies and procedures, we submit this request for approval of the Charlotte OAPM EA identified aircraft types of interest (Attachment A).

While NIRS 7.0b.3 is consistent with the Integrated Noise Model (INM), version 7.0b, and therefore contains all of its supporting noise data, certain aircraft types that occur in the Metroplex existing and forecast fleets are not included in the NIRS database. In addition, there are no arrival procedure step profiles included with some aircraft types, meaning that NIRS will be unable to adequately reflect the noise from existing step-down procedures and thus permit comparisons to the proposed new OPDs. In these cases we have attempted to identify surrogate arrival aircraft types that would be compatible with NIRS. We request that the FAA review approve these NIRS 7.0b3 substitutes for each of these aircraft models or provide a suitable substitution.

In accordance with FAA policy, we expect that this request will be reviewed by the FAA's Airspace Regulations & ATC Procedures Group Mission Support Services Group (AJV-114) and Office of Environment and Energy Noise Division (AEE-100). We will be happy to respond to questions regarding this request from yourself or those offices.

Thank you for your assistance on this matter.

Sincerely yours,

A handwritten signature in purple ink that reads "William Keller". The signature is fluid and cursive, with the first name "William" and last name "Keller" clearly visible.

William Keller
ATAC Corporation, Inc.

Attachments:
Attachment A: NIRS Aircraft Substitution Requests and Suggestions

Attachment A: NIRS Aircraft Substitution Requests and Suggestions

The following aircraft types included in the Charlotte OAPM EA require an FAA approved substitution. In each case, a recommended substitute from the NIRS 7.0b3 or INM 7.0c database, an FAA validated substitution from other OAPM studies, or a similar aircraft type from the existing NIRS 7.0b3 or INM 7.0c database is presented.

Table 1 presents a subset of standard approved aircraft substitutions containing procedural profiles available in NIRS 7.0b3 and INM 7.0c that are used in this study. Table 2 presents aircraft substitutions that were previously submitted by ATAC and HMMH and approved by the FAA AEE. These approvals were for the Houston OAPM EA dated August 10, 2012, the North Texas OAPM EA dated October 17, 2012, the Washington D.C. OAPM EA dated December 13, 2012, the Atlanta OAPM EA dated November 18, 2013, and the Northern California OAPM EA dated January 9, 2014. Table 3 lists aircraft types that neither have a standard NIRS substitution nor an approved utilization submission from a prior OAPM EA. In each case, the aircraft substitution choices are discussed in subsections following the tables. Also contained within this table are any deviations of standard NIRS types or substitutions that have already been approved.

NIRS uses procedure steps to best model the aircraft profiles. Some model types only have procedure steps for departure procedures and therefore a substitute must be supplied for the arrivals. Therefore, Tables 1, 2, and 3 each present a recommended NIRS substitution for both arrival and departure procedures.

1.1 Cessna Citation

The C65X is an airframe variant of the Cessna Citation III C650 which has an approved NIRS substitution of CIT3.

1.2 GASEPF Type Aircraft

The AC10, EXPA, PA40, PTS2, and PITT are all single engine aircraft similar to (or variants of) the GASEPF NIRS type.

1.3 GASEPV Type Aircraft

The M5 and M20A/B/C/E/F/G/M/R are all single engine aircraft similar to (or variants of) the GASEPV NIRS type.

Date: June 16, 2014

Ms. Kristi Ashley
Environmental and Airspace Specialist
Federal Aviation Administration
Eastern Service Area
Operations Support Group
1701 Columbia Ave.
College Park, GA 30337

Dear Ms. Ashley,

The Office of Environment and Energy (AEE) has received the letter addressed to you from ATAC Corporation dated May 28, 2014 for noise analysis in support of the Charlotte Optimization of Airspace and Procedures in the Metroplex (OAPM) Environmental Assessment (EA). ATAC is developing the inputs for the Noise Integrated Routing System (NIRS), which will be used to model the noise effects resulting from proposed changes to the airspace.

Certain aircraft types that occur in the Metroplex existing and forecast fleets are not included in the NIRS database. In addition, there are no arrival procedure step profiles included with some aircraft types; therefore NIRS will not be able to compare existing step-down procedures to proposed new Optimized Profile Descents (OPD). To remedy this, ATAC has identified surrogate aircraft types that are compatible with NIRS to be used as substitute aircraft for noise modeling. These aircraft and the ATAC proposed substitutes are listed in Attachment A of the ATAC letter.

AEE approves the use of the substitutions proposed by ATAC for the Charlotte OAPM EA. Please understand that this approval is limited to the Charlotte OAPM EA project. Any additional projects or non-standard aircraft input will require separate approval.

Sincerely,

Rebecca Cointin, Manager
AEE/Noise Division

2. Inventory of Section 4(f) Resources

2. Inventory of Section 4(f) Resources

This appendix provides an inventory of potential Department of Transportation Act (DOT Act), Section 4(f) properties identified and evaluated as part of the Environmental Assessment (EA) for the Charlotte Optimization of Airspace and Procedures in the Metroplex (CLT OAPM) project.

2.1 Inventory

The inventory of potential Section 4(f) properties is intended to include all public park; recreation area; wildlife and waterfowl refuges of national, state, or local significance as well as properties listed on the National Register of Historic Places (National Register) located within the General Study Area. Spatial data for these properties was downloaded from federal, state, and local sources, identified in **Table 1**. Properties listed on the National Register and considered under both Section 4(f) and Section 106 of the National Historic Preservation Act (16 U.S.C. § 470) are included in **Appendix 3**.

2.1.1 Noise Exposure at Section 4(f) Properties

Table 2 identifies noise values modeled at 17,430 grid points for the Section 4(f) properties identified within the General Study Area. The inventory includes the name, state, acreage, and geographical coordinates (latitude and longitude) of each potential resource, and presents the calculated noise exposure values under 2011 existing conditions and Proposed Action and No Action conditions for 2015 and 2020.

3. Inventory of Historic Resources

3. Inventory of Historic Resources

This appendix provides an inventory of historical resources identified and evaluated as part of the Environmental Assessment (EA) for the Charlotte Optimization of Airspace Procedures in the Metroplex (CTL OAPM) project.

3.1. Inventory

The inventory of historic resources includes all properties listed on the National Register of Historic Places (National Register) located within the General Study Area. Spatial data for these properties was downloaded from the National Park Service website (nrmhp.focus.nps.gov/natreg/docs/Download.htm) in August 2012. This database was augmented in February 2013 with additional data reflecting newly listed properties on the National Register.

3.2. Consultation

On June 11, 2014, early notification letters announcing the preparation of an EA for the CLT OAPM project and requesting additional information relevant to the project were distributed to relevant public officials, including the State Historic Preservation Officers (SHPO) for the States of Georgia, North Carolina, and South Carolina, and all Native American tribes within the General Study Area.

The response letters are included in **Appendix A**.

3.2.1.Noise Exposure at Historic Sites

Table 1 identifies the 1,246 historic resources identified within the General Study Area and for which noise was modeled. The inventory includes the name and geographical coordinates (latitude and longitude) of each historic resource, and presents the calculated noise exposure values under 2011 existing conditions and Proposed Action and No Action conditions for 2015 and 2020.
