Appendix A ACRONYMS, ABBREVIATIONS AND GLOSSARY OF TERMS

Table A-1 Acronyms

Acronym	Full Phrase
AAD	Average Annual Day
ACCRI	Aviation Climate change Research Initiative
ACHP	Advisory Council on Historic Preservation
ADS	Automatic Dependent Surveillance
AEE	FAA Office of Environment and Energy
AFE	Above Field Elevation
AGL	Above Ground Level
APE	Area of Potential Effect
ARTCC	Air Route Traffic Control Center
ATC	Air Traffic Control
ATCT	Air Traffic Control Tower
ATO	Air Traffic Organization
C90	Chicago Terminal Radar Approach Control
CAA	Federal Clean Air Act of 1979
CDA	The City of Chicago Department of Aviation
CEQ	Council on Environmental Quality
CFR	Code of Federal Regulations
CGT	Chicago Heights VOR
CH ₄	Methane
CO	Carbon Monoxide
CO ₂	Carbon Dioxide
CVA	Davenport VOR
CY	Calendar Year
dB	Decibel
DME	Distance Measuring Equipment
DNL	Day-Night Average Sound Level
DNR	Department of Natural Resources
DOI	Department of Interior
DOT	Department of Transportation
EA	Environmental Assessment
EIS	Environmental Impact Statement
EJ	Environmental Justice
EO	Executive Order
EPA	Environmental Protection Agency
ESA	United States Endangered Species Act of 1973
FAA	Federal Aviation Administration
FICON	Federal Agency Committee on Noise
FMS	Flight Management System
FWA	Fort Wayne VOR
GA	General Aviation
GAO	General Accounting Office
GHG	Greenhouse Gas
GIS	Geographic Information System
GPS	Global Positioning System
HFC	Hydro Fluorocarbons
HHS	Department of Health and Human Services
HUD	United States Department of Housing and Urban Development
ICAO	International Civil Aviation Organization
IFR	Instrument Flight Rules
ILS	Instrument Landing System

IMC	Instrument Meteorological Conditions
INM	Integrated Noise Model
IPCC	Intergovernmental Panel on Climate Change
JO	Joint Order
JOT	Joliet VOR
L/R	Left/Right
L _{eq}	Equivalent Sound Level
LFD	Litchfield VOR
L _{max}	Maximum Sound Level
LOC	Localizer
LWCF	Land and Water Conservation Fund
MBTA	Migratory Bird Treaty Act of 1918
MDW	Midway International Airport
MNFI	Michigan Natural Features Inventory
MOU	Memoranda of Understanding
MSL	Mean Sea Level
MT	Metric Tons
MT CO _{2e}	Metric Tons of Carbon Dioxide Equivalent
N ₂ O	Nitrous Oxide
NAAQS	National Ambient Air Quality Standards
NAS	National Airspace System
NASA	National Aeronautics and Space Administration
NATCA	National Air Traffic Control Administration
NAVAIDs	Navigational Aids
NCDC	National Climatic Data Center
NEPA	National Environmental Policy Act of 1969
NextGen	Next Generation Air Transportation System
NHPA	National Historic Preservation Act of 1966
NIRS	Noise integrated Routing System
NM	Nautical Miles
NMFS	National Marine Fisheries Service
NO ₂	Nitrogen Dioxide
NPS	National Park Service
NRHP	National Register of Historic Places
O ₃	Ozone
OKK	Kokomo VOR
ORD	Chicago O'Hare International Airport
PARTNER	Partnership for Air Transportation Noise & Emissions Reduction
Pb	Lead
PBN	Performance Based Navigation
PM	Particulate Matter
PM ₁₀	Particulate matter with a diameter of less than 10 micrometers
PM _{2.5}	Particulate matter with a diameter of less than 2.5 micrometers
PTC	Presumed to Conform
RNAV	Area Navigation
RNP	Required Navigation Performance
SEL	Sound Exposure Level
SF ₆	Sulfur Hexafluoride
SHPO	State Historic Preservation Officer
SIAP	Standard Instrument Approach Procedure
SID	Standard Instrument Departure
SIP	State Implementation Plan
SO ₂	Sulfur Dioxide
SOP	Standard Operating Procedure
SPI	Spinner VOR

SPL	Sound Pressure Level
STAR	RNAV Standard Terminal Arrival
TAF	Terminal Area Forecast
TARGETS	Terminal Area Route Generation, Evaluation, Traffic and Simulation
THPO	Tribal Historic Preservation Officer
TRACON	Terminal Radar Approach Control
USC	United States Code
USFWS	United States Fish and Wildlife Service
USGS	United States Geological Survey
VFR	Visual Flight Rules
VMC	Visual Meteorological Conditions
VOR	VHF Omni-directional Range
YDNL	Yearly Day-Night Average Sound Level
ZAU	Chicago Air Route Traffic Control Center

Table A-2 Glossary of Terms

A-Weighted Sound Level	A quantity, in decibels, read from a standard sound-level meter with A-weighting circuitry. The A-weighting scale discriminates against the lower frequencies below 1000 hertz according to a relationship approximating the auditory sensitivity of the human ear. The A-weighted sound level is approximately related to the relative “noisiness” or “annoyance” of many common sounds.
Acoustics	The science of sound, including the generation, transmission, and effects of sound waves, both audible and inaudible.
Air Carrier	An entity holding a Certificate of Public Convenience and Necessity issued by the Department of Transportation (DOT) to conduct scheduled air services over specified routes and a limited amount of non-scheduled operations.
Air Pollutant	Any substance in air that could, in high enough concentration, harm man, other animals, vegetation, or material. Pollutants may include almost any natural or artificial composition of airborne matter capable of being airborne. They may be in gases, particulates, or in combinations thereof. Generally, they fall into two main groups: (1) those emitted directly from identifiable sources and (2) those produced in the air by interaction between two or more primary pollutants, or by reaction with normal atmospheric constituents, with or without photo-activation.
Air Route Traffic Control Center (ARTCC, Center)	An FAA facility established to provide air traffic control service to aircraft operating on an Instrument Flight Rules (IFR) flight plan within controlled airspace and principally during the en-route phase of flight. When equipment capabilities and controller workload permit, certain advisory/assistance services may be provided to Visual Flight Rules (VFR).
Air Traffic Control (ATC)	A service operated by appropriate authority to promote the safe, orderly, and expeditious flow of air traffic.
Airport Traffic Control Tower (ATCT)	A facility that uses air/ground communications, visual signaling, and other devices to provide ATC services to aircraft operating in the vicinity of an airport. Authorizes aircraft to land or take-off at the airport controlled by the tower regardless of flight plan or weather conditions.
Airspace	Navigable area used by aircraft for purposes of flight.
Airway	An area of Class E airspace established in the form of a corridor, the centerline of which is defined by radio navigational aids. The network of airways serving aircraft operations up to but not including 18,000 feet MSL are referred to as “Victor” airways. The network of airways serving aircraft operations at or above 18,000 feet MSL are referred to as a “Jet Route”.
Altitude	Height above a reference point, usually expressed in feet. Reference points are typically sea level, the ground, or airfield elevation in which case MSL, AGL or AFE further describes the altitude, respectively.
Ambient Noise Level	The level of noise that is all-encompassing within a given environment for which a single source cannot be determined. It is usually a composite of sounds from many and varied sources near to and far from the receiver.
Area Navigation (RNAV)	A method of air navigation that permits aircraft to operate on any desired course within a network of station-referenced navigation aids (NAVAIDs), rather than navigating directly to and from the NAVAIDs.
Arithmetic Averaged Sound Pressure Level	The arithmetic sum of a series of sound pressure levels divided by the number of levels included in the sum.
Arrival Stream	A flow of aircraft that are following similar arrival procedures. This can conserve flight distance, reduce congestion, and allow instrument flight plans into airports with limited NAVAIDs.
Attainment Area	An area in which the Federal or state standards for ambient air quality are being achieved.
Automated Radar Terminal System (ARTS)	Computer-aided radar display subsystems capable of associating alphanumeric data, such as aircraft identification, altitude, and airspeed with aircraft radar returns.

Based Aircraft	Active aircraft that are stationed at an airport on a permanent basis.
Block	Census blocks are small areas bounded on all sides by visible features such as streets, roads, streams, and railroad tracks, and by invisible boundaries such as city, town, township, and county limits; property lines; and short, imaginary extensions of streets and roads. Blocks are numbered uniquely within each census tract or block numbering area (BNA). A three-digit number identifies a block, sometimes with a single alphabetical suffix. The U.S. Bureau of Census designates census blocks.
Census Block	A U.S. Census block group is one of several geographical units by which the U.S. Census Bureau organizes data and is the smallest such unit available for this analysis throughout the study area.
Centroid	A point representing the geographic center of a US Bureau of Census' census block.
Climb	The act or instance of increasing altitude.
Conformity	A determination that a project conforms with a State Implementation Plan (SIP) whose purpose is to eliminate or reduce the severity and number of violations of the National Ambient Air Quality Standards; and does not impede the scheduled attainment of such standards.
Constructive Use	When the proximity impacts (e.g., noise) of a proposed project adjacent to, or near, a Section 4(f) property result in substantial impairment of the property
Controlled Airspace	Airspace of defined dimensions within which air traffic control service is provided to IFR flights and to VFR flights in accordance with the airspace classification.
Corner Posts	The relative geographical locations with respect to TRACON airspace that allow referencing various arrival procedures based on the direction from which they enter the Airport general area.
Criteria Pollutants	The 1970 amendments to the Clean Air Act required EPA to set National Ambient Air Quality Standards for certain pollutants known to be hazardous to human health. EPA has identified and set standards to protect human health and welfare for six pollutants: ozone, carbon monoxide, total suspended particulates, sulfur dioxide, lead, and nitrogen oxide. The term, "criteria pollutants" derives from the requirement that EPA must describe the characteristics and potential health and welfare effects of these pollutants. It is on the basis of these criteria that standards are set or revised.
Day-Night Average Sound Level (DNL)	A measure of the annual average noise environment over a 24-hour day. It is the 24-hour, logarithmic- (or energy-) average, A-weighted sound pressure level with a 10-decibel penalty applied to the nighttime event levels that occur between 10 p.m. and 7 a.m.
De minimis Levels	De minimis is defined as lacking significance or importance, or so minor as to be disregarded. De minimis levels are minimum air pollutant levels and vary according to the type of pollutant and severity of the non-attainment area. Unless state minimums are lower than Federal, these levels are consistent for all conformity determinations. The calculation of total project emissions is made and compared to these de minimis cutoffs. If the emissions for a pollutant are above de minimis, the project requires a conformity determination. All emissions from the project must be analyzed and found to conform, not only those above the de minimis levels.
Decibel (dB)	Commonly used to define the level produced by a sound source. The decibel scale is logarithmic (e.g., when the scale goes up by ten, the perceived level is twice as loud)
Departure	The act of an aircraft taking off from an airport.
Departure Procedure (DP)	A preplanned IFR ATC departure procedure printed for pilot use in graphic and/or textual form. DPs provide transition from the terminal to the appropriate en route structure.
Descent	The process of decreasing altitude.
Downwind	In the direction in which the wind blows, with the wind behind.
Emissions	Pollution discharged into the atmosphere from stationary sources such as smokestacks, surface areas of commercial or industrial facilities, residential chimneys, and from mobile sources such as motor vehicles, locomotives, or aircraft exhausts.
En Route Airspace	A general term to describe the airspace controlled by an ARTCC.
Energy-Averaged Sound Pressure Level	The logarithmic sum of the sound power of a series of sound pressure levels divided by the number of levels included in the sum.
Enplanement	The total number of revenue passengers boarding aircraft, including originating, stopover, and transfer passengers, in scheduled and non-scheduled services.
Environmental Assessment (EA)	An EA is a concise document used to describe the environmental impacts of a proposed Federal action.
Environmental Noise	Unwanted sound from various outdoor sources that produce noise (e.g., aircraft, cars, trucks, buses, railways, industrial plants, construction activities)
Equipage	Navigation and aircraft surveillance equipment installed on aircraft
Equivalent Sound Level (Leq)	The level of a constant sound, which, in the given situation and time period, has the same average sound energy, as does a time-varying sound. Specifically, equivalent sound level is the energy-averaged sound pressure level of the individual A-weighted sound pressure levels occurring during the time interval.

Federal Aviation Administration (FAA)	The Federal Aviation Administration (FAA) is the agency of the United States government with primary responsibility for civil aviation. Among its major functions are the regulation of civil aviation to promote safety, fulfill the requirements of national defense and development, and operate a common system of air traffic control and navigation for both civil and military aircraft.
Fix	A geographical position determined by reference to one or more radio NAVAIDS, celestial plotting, or by some other means such as satellite navigation.
Flight Data Information	Specific information used by ATC for an individual flight, including information such as aircraft identification, destination, type, route, and altitude.
Flight Management Systems (FMS)	An FMS is an integrated suite of sensors, receivers, and computers, coupled with a navigation database. These systems generally provide performance and RNAV guidance to displays and automatic flight control systems.
Flight Track	The route used by an aircraft in flight.
Flow	The direction in which aircraft take-off and land at a particular airport. Aircraft generally take-off and land into the wind. However, other factors (e.g., nearby airports, construction) can also affect flow.
Flyways	Migration routes for avian species.
Frequency (acoustic)	The number of oscillations per second completed by a vibrating object.
General Aviation (GA)	That portion of civil aviation which encompasses all facets of aviation except air carriers holding a certificate of public convenience and necessity from the Civil Aeronautics Board and large aircraft commercial operators.
Global Positioning System (GPS)	A satellite-based radio positioning and navigation system operated by the U.S. Department of Defense. The system provides highly accurate position and velocity information, and precise time, on a continuous global basis to an unlimited number of properly equipped users.
Hand-Off	An action taken to transfer the radar identification of an aircraft from one controller to another. When the aircraft enters the receiving controller's airspace, radio communications with the aircraft are transferred.
Heading	A compass bearing indicating the direction of travel.
Hertz (Hz)	The unit used to designate frequency; specifically, the number of cycles per second.
Household	A household includes all the persons who occupy a housing unit. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or unrelated persons who share living arrangements.
Housing Unit	A housing unit is a house, apartment, a mobile home or trailer, a group of rooms or a single room occupied as separate living quarters or, if vacant, intended for occupancy as separate living quarters.
Hydrocarbons (HC)	Chemical compounds that consist entirely of carbon and hydrogen.
Instrument Departure Procedure	A preplanned instrument flight rule (IFR) departure procedure published for pilot use, in graphic or textual format, that provides obstruction clearance from the terminal area to the appropriate en route structure. There are two types of DP, Obstacle Departure Procedure (ODP), printed either textually or graphically, and, Standard Instrument Departure (SID), which is always printed graphically.
Instrument Flight Rules (IFR)	Rules governing the procedures for conducting instrument flight in aircraft. Also a term used by pilots and controllers to indicate type of flight plan.
Instrument Landing System	A precision instrument approach system that normally consists of the following electronic components and visual aids: a) Localizer (provides course guidance to the runway); b) Glideslope (provides vertical guidance for aircraft during approach and landing); c) Outer Marker (a marker beacon at or near the glideslope intercept altitude of an ILS approach); d) Middle Marker (a marker beacon that defines a point along the glideslope of an ILS normally located at or near the point of decision height); and e) Approach Lights (an airport lighting facility that provides visual guidance to landing aircraft by radiating light beams in a directional pattern by which the pilot aligns the aircraft with the extended centerline of the runway on his/her final approach for landing).
Instrument Meteorological Conditions (IMC)	Weather conditions expressed in terms of visibility, distance from clouds, and cloud ceilings during which all aircraft are required to operate using Instrument Flight Rules (IFR).
Integrated Noise Model (INM)	A computer program developed, updated and maintained by the Federal Aviation Administration to evaluate aircraft noise impacts in the vicinity of airports.
In-Trail Spacing	The distance between two aircraft on an identical route; one aircraft is following another.
Invasive Species	Invasive species are organisms (usually transported by humans) that successfully establish themselves in, and then overcome, otherwise intact, pre-existing native ecosystems.
Knots	Speed measured in nautical miles per hour.
Level-off	The process by which an aircraft that is initially changing altitude maintains a constant altitude. This can be done once the aircraft reaches its cruise altitude in the en route environment, or as a series of steps taken as the aircraft transition to/from the en route environment to guarantee adequate separation from other aircraft.

Loudness	The attribute of an auditory sensation in terms of which sounds may be ordered on a scale extending from soft to loud. Loudness depends primarily upon the sound pressure of the source, but it also depends upon the frequency and waveform of the source.
Low-Income	A person whose median household income is at or below the Department of Health and Human Services poverty guidelines
Mean Sea Level (MSL)	The height of the surface of the sea for all stages of the tide, used as a reference for elevations or altitude of aircraft flight. Also called sea level datum.
National Airspace System (NAS)	The common network of air navigation facilities, equipment and services, airports or landing areas; aeronautical charts, information and services; rules, regulations and procedures, technical information, and manpower and material.
National Ambient Air Quality Standards (NAAQS)	Standards for criteria pollutants established by United States Environmental Protection Agency that apply to outdoor air.
Natural Areas	Undeveloped areas of land such as parks, wildlife refuges/management areas, and nature preserves.
Nautical Mile (NM)	A measure of distance equal to 1 minute of arc on the earth's surface (approx. 6,076 ft.).
Navigation Aids (NAVAIDs)	Any visual or electronic device airborne or on the surface that provides point to point guidance information or position data to aircraft in-flight.
Next Generation Air Transportation System	A program shifting aircraft procedures from fixed. Ground-based radio navigation transmitting facilities and radar to satellite, or GPS, navigation and onboard surveillance
Noise	Any sound that is undesirable because it interferes with speech and hearing, or is intense enough to damage hearing, or is otherwise annoying.
Noise Exposure	The cumulative acoustic stimulation reaching the ear of a person over a specified period of time (e.g., a work shift, a day, a working life, or a lifetime).
Noise Integrated Routing System (NIRS)	A computer program developed, updated, and maintained by the FAA to evaluate aircraft noise impact for air traffic actions involving multiple airports over broad geographic areas.
Non-Attainment Area	Areas with levels that exceed one or more of the NAAQS for the criteria pollutants designated in the Clean Air Act.
Non-Directional Beacon (NDB)	A radio beacon transmitting non-directional signals whereby the pilot of an aircraft equipped with direction finding equipment can determine his bearing to or from the radio beacon and "home" on or track to or from the station. When the radio beacon is installed in conjunction with the Instrument Land System (ILS) marker, it is normally called a Compass Locator.
Operation	Landing or take-off of an aircraft.
Over-flights	Aircraft whose flights originate or terminate outside the controlling facility's area that transit the airspace without landing.
Performance-Based Navigation (PBN)	Specifies that aircraft Required Navigation Performance (RNP) and Area Navigation (RNAV) systems performance requirements be defined in terms of accuracy, integrity, availability, continuity and functionality required for the proposed operations in the context of a particular airspace, when supported by the appropriate navigation infrastructure.
Piston Aircraft	Propeller-driven aircraft powered by an internal combustion engine.
Power Settings	Amount of engine power used by the pilot.
Quadrant	A quarter part of a circle, centered on a NAVAID oriented clockwise from magnetic north.
Radar (primary)	A device which, by measuring the time interval between transmission and reception of radio pulses, and correlating the angular orientation of the radiated antenna beam, or beams in azimuth and/or elevation, provides information on range, azimuth, and /or elevation of objects in the path of the transmitted pulses. Also known as "Primary Radar".
Radar (secondary)	A radar system in which the object to be detected is fitted with cooperative equipment in the form of a radio receiver/transmitter (transponder). Radar pulses transmitted from the searching transmitter/receiver (interrogator) site are received in the cooperative equipment and used to trigger a distinctive transmission from the transponder. This reply transmission, rather than a reflected signal, is then received back at the interrogator site for processing and display at an ATC facility. Also known as a "Radar Beacon".
Radial	A magnetic bearing extending from a VOR/VORTAC/TACAN navigation facility.
Required Navigation Performance (RNP)	A type of performance-based navigation (PBN) that allows an aircraft to fly a specific path between two 3-dimensionally defined points in space. RNP differs from Area Navigation (RNAV) systems in that there is a requirement for on-board performance monitoring and alerting specification.
RNAV (VOR/DME)	A SIAP that employs Area Navigation using a combination of VHF Omni-directional Range (VOR) and Distance Measuring Equipment (DME) ground stations for navigational course guidance.
Satellite Navigation	See Global Positioning System (GPS).
Section 4(f)	A resource that may be protected under special provisions of the U.S. Department of Transportation Act, 49 USC 303(c).
Sector	A defined volume of airspace, including both lateral and vertical limits, in which a single air traffic controller is responsible for the safe movement of air traffic. A TRACON's or ARTCC's airspace is comprised of multiple sectors.
Separation	Spacing between aircraft. This spacing may be vertical, lateral, longitudinal, or visual.

Sequencing	Procedure in which air traffic is merged into an orderly flow.
Sound Exposure Level (SEL)	A time-integrated metric (i.e., continuously summed over a time period) that quantifies the total energy in the A-weighted sound level measured during a transient noise event. The time period for this measurement is generally taken to be that between the moments when the A-weighted sound level is 10 dB below the maximum.
Sound Pressure Level	A measure, in decibels, of the magnitude of the sound. Specifically, the sound pressure level of a sound that is 10 times the logarithm to the base 10 of the ratio of the squared pressure of this sound to the squared reference pressure. The reference pressure is usually taken to be 20 micropascals. See also Energy-Averaged Sound Pressure Level.
Source (acoustic)	The object that generates the sound.
Standard Instrument Approach Procedure (SIAP)	A series of predetermined maneuvers for the orderly transfer of an aircraft under instrument flight conditions from the beginning of the initial approach to a land or to a point from which a landing may be made visually. It is prescribed and approved of a specific airport by a competent authority
Standard Terminal Arrival (STAR)	A preplanned instrument flight rule (IFR) air traffic control arrival procedure published for pilot use in graphic and/or textual form. STAR's provide transition from the en route structure to an outer fix or an instrument approach fix/arrival waypoint in the terminal area.
Statute Mile (SM)	A measure of distance equal to 5,280 feet.
Sulfur Dioxide (SO ₂)	Sulfur dioxide typically results from combustion processes, refining of petroleum, and other industrial processes.
Tactical Air Navigation (TACAN)	An ultra-high frequency electronic air navigation aid that provides equipped aircraft a continuous indication of bearing and distance to the station.
Tactical Separation	The separation of aircraft by air traffic control instruction via radio voice communication
Terminal Area	A general term used to describe airspace in which approach control services for airport traffic control service is provided.
Terminal Radar Approach Control (TRACON)	An FAA ATC facility that uses radar and two-way radio communication to provide separation of air traffic within a specified geographic area in the vicinity of one or more large airports.
Time Above (TA or TALA)	The TA noise metric provides the duration in minutes for which aircraft-related noise exceeded a specified A-weighted sound level. If not stated otherwise, TA pertains to a 24-hour day. (e.g., A TA65 [or TALA65] of 17 minutes means that 65 dB was exceeded for a total of 17 minutes of the course of a 24-hour day.)
Topography	The configuration of a surface including its relief and the position of its natural and man-made features.
T-route	A route that corresponds to the RNAV IFR Terminal Transition Route (RITTR) program, and begins and ends at current fixes or NAVAIDs on Victor Airways in terminal airspace.
Turboprop Aircraft	An aircraft whose main propulsive force is provided by a propeller driven by a gas turbine. Additional propulsive force may be provided by gas discharged from the turbine exhaust.
Vector	Heading instructions issued by ATC to provide navigational guidance by radar.
Vector Airway	An airspace area established in the form of a corridor, the centerline of which is defined by radio navigational aids.
Very High Frequency Omni-directional Radio Range Station (VOR)	A ground-based electronic navigation aid transmitting very high frequency navigation signals, 360° in azimuth, oriented from magnetic North. Distance Measuring Equipment (DME) may be installed. Used as a basis for navigation in the National Airspace System.
Very High Frequency Omni-directional Range with Tactical Air Navigation (VORTAC)	A navigation aid providing VOR azimuth, TACAN azimuth, and TACAN distance measuring equipment (DME) at one site. The most common form of radio navigation currently in use.
Visual Flight Rules (VFR)	Rules that govern the procedures for conducting flight under visual conditions. The term 'VFR' is also used in the United States to indicate weather conditions that are equal to or greater than minimum VFR requirements. In addition, it is used by pilots and controllers to indicate type of flight plan.
Visual Meteorological Conditions (VMC)	Weather conditions expressed in terms of visibility, distance from cloud, and ceiling, equal to or better than specified minima.

Appendix C LIST OF PREPARERS

As required by FAA Order 1050.1E, this section identifies the names and qualifications of the principal persons contributing information to this EA. The FAA employed the efforts of an interdisciplinary team of scientists, technicians, and experts in various fields to accomplish this study, as required by Section 1502.6 of Council on Environmental Quality (CEQ) regulations. Specialists involved in this EA included FAA and support contractor staff in fields such as air traffic control, airspace planning, noise assessment and abatement, DOT Section 4(f) resources, avian and bat species, and other disciplines. While an interdisciplinary approach has been used to develop the EA, all decisions made with regard to the content and scope of the EA are those of the FAA.

Harris Miller Miller & Hanson Inc.

Name: Vinayak Khera

Job Title: Vice President

Education: M.S., Environmental Engineering; B.S., Aircraft Engineering (minor in Aviation Business Administration); B.A., Economics

Years of Experience: 13

Areas of Expertise Relating to the Project: Specializes in system and state-wide planning studies, airport and airspace design studies and environmental planning for airports. Has worked with federal, state, and local governments, as well as community groups, for more than 13 years to find balanced solutions to issues involving the effects of new capacity-enhancing technologies and policies on the environment. He also has managed several airspace environmental projects. Presently, is principal-in-charge of all of HMMH's OAPM environmental projects.

Project Responsibilities: Project Manager

Name: Diana Wasiuk, PMP

Job Title: Chief Operations Officer

Education: M.B.A., Aviation; B.A., Aviation Business Administration

Years of Experience: 13

Areas of Expertise Relating to the Project: Expert in airfield and airspace operations of both complex commercial airports as well as smaller GA airports. Has served as Project Manager and subject matter expert for several regional airspace redesigns, airport capacity enhancement projects, master plans, NEPA environmental studies and NextGen implementation initiatives. Serves as subject matter expert to industry research groups and conference panels.

Project Responsibilities: Deputy Project Manager, Document Review and Quality Control

Name: Kurt Hellauer

Job Title: Principal Consultant

Education: B.A., Government

Years of Experience: 25

Areas of Expertise Relating to the Project: National Environmental Policy Act (NEPA) program management, environmental impact analysis, and land-use planning. Background in aircraft operations modeling, airspace analysis, airport operations, and land use planning. Certified FAA Commercial Pilot.

Project Responsibilities: Alternatives, Affected Environment, DOT Section 4(f) Properties, Historic & Cultural Resources.

Name: Rhea Hanrahan

Job Title: Consultant

Education: B.S., Physics

Years of Experience: 3

Areas of Expertise Relating to the Project:

Has participated in Part 150 Studies, Sound Insulation Programs, and supported several noise measurement projects. Has experience in Flight Track Analysis, Environmental Impact Studies, and other studies related to State and local requirements.

Project Responsibilities: NIRS Technical Lead

Name: Jesse Lambert

Job Title: Senior Consultant

Education: M.A., International Commerce and Policy; B.A., Political Science

Years of Experience: 5

Areas of Expertise Relating to the Project: Significant experience with research, analysis, and writing for policy initiatives and legal review. Has worked with multiple Federal government-led projects, managing document editing and coordination responsibilities. Supported the FAA Joint Planning and Development Office related to long-term aviation planning for NextGen. Familiar with NextGen aviation concepts and environmental policy.

Project Responsibilities: Editing, Technical Writing, and Document Management

Name: Kirk Harris

Job Title: Consultant

Education: M.B.A., Entrepreneurship; B.S., Aviation Management

Years of Experience: 5

Areas of Expertise Relating to the Project: Airline dispatcher and operations specialist. FAA Commercial Pilot Certificate. Program Management Support to the FAA/Joint Planning and Development office, including leading industry experts of the Aircraft Working Group/Equipage Standing Committee and the Global Harmonization Working Group.

Project Responsibilities: Project Research and Document Development

Name: Chris Waite

Job Title: Consultant

Education: B.A., Physics

Years of Experience: 2

Areas of Expertise Relating to the Project: Part 161 studies, Flight Track Analysis, Environmental Impact Studies, and other studies related to State and local requirements. Sound Insulation Programs & GIS Measurement Technician. Experienced user of the Federal Aviation Administration's airport noise models, the Integrated Noise Model

Project Responsibilities: Noise Impact Analysis – Technical Lead

Name: Michael Hamilton

Job Title: Senior Geographic Information Specialist

Education: B.S., Geographic Information Systems & Cartography; A.S., Survey and Highway Engineering Technology

Years of Experience: 28

Areas of Expertise Relating to the Project: Use of graphics applications (GIS and CAD) for noise contour creation, overlay, manipulation, environmental noise impacts, Census data analysis including environmental justice and population impacts, noise sensitive mapping, land use mapping and analysis, noise barrier and noise mitigation mapping.

Project Responsibilities: Geographic Information Spatial Analysis and Graphics

Name: Phil DeVita

Job Title: Director, Air Quality

Education: M.S., Environmental Studies; B.S., Meteorology

Years of Experience: 20

Areas of Expertise Relating to the Project: Expert in air quality permitting and modeling, wind turbine and solar evaluation, air emissions characterization, and meteorological monitoring.

Project Responsibilities: Air Quality, Natural Resources, and Climate Change Analysis

Name: Stephen Barrett

Job Title: Director, Clean Energy

Education: M.A., Environmental Science and Policy; B.A., International Relations

Years of Experience: 15

Areas of Expertise Relating to the Project: environmental and regulatory consulting and project management. Active in renewable energy and sustainable development initiatives, included in the siting design and LEED analysis, and the permitting of energy, infrastructure, and real estate projects.

Project Responsibilities: Wildlife-related Analysis

Name: Laura Taylor

Job Title: Administrative Assistant

Years of Experience: 30

Areas of Expertise Relating to the Project: Over 30 years of professional support experience including high level project management support, government liaison, the organization of public events and annual meetings, including logistics, event recording, working with event sponsors and vendors, scheduling, record keeping, and public interface.

Project Responsibilities: Administrative Officer

Mosaic ATM

Name: Michael Graham

Job Title: Principal Analyst

Education: B.S., Computer Science

Years of Experience: 26

Areas of Expertize Relating to the Project: Leads multiple environmental studies for both the FAA and NASA performing model development, flight track analysis, including several national and regional impact studies that included noise, emissions and fuel burn. Specifically managed and supported development of the FAA NIRS tool as well as AEDT and the application of these tools for many FAA Airspace Redesign Projects.

URS Corporation

Name: Paul Behrens

Job Title: Manager, Airport Planning and Environmental Group

Education: M.S., Biology; B.S., Marine Science

Years of Experience: 35

Areas of Expertize Relating to Project: Has participated in Environmental Impact Studies, Part 150 Studies, DOT Section 4(f) Studies, and other environmental planning and assessment programs airports and a broad range of federal facilities and programs.

Name: Peter M. Green, AICP

Job Title: Senior Airport Environmental Planner

Education: M.P.A., Public Administration/Coastal Zone Studies; B.S., Environmental Resource Planning & Management

Years of Experience: 25

Areas of Expertize Relating to the Project: Has prepared numerous Environmental Assessments, environmental impact studies, and permit applications for a wide variety of airport development projects throughout the US. Has extensive experience preparing airport planning studies, Airport Master Plans, and Airport Layout Plans.

Appendix D AIR TRAFFIC PROCEDURES

U.S. Department
of Transportation
**Federal Aviation
Administration**

May 20, 2013

To whom it may concern:

Minor changes to the Targets Distribution packages have been made since the printing of the Draft EA. FAA does not expect these minor revisions to change the track of the aircraft using the proposed procedures.

Sincerely,

Thomas L. Lattimer
Manager
Airspace Redesign Program

To: AARON J. FRAME
From: Jeffrey A. Jackson
Cc: Amy Malick, Ted J. Woosley
Date: January 23, 2013, January 24, 2013 (revised)
Re: Midway Future Eastbound Departure Changes

Based on comments from the FAA including today's new departure track information, future 22L arrival procedures will impact eastbound departures for runways 13L, 13C, 13R, 22L, 22R, 31L, 31C and 31R. This will only occur while aircraft are arriving runway 22L. When 22L arrivals are not occurring, eastbound departures will continue to operate as they do today.

When 22L arrivals are occurring, departures for runways 22L, 22R, 31L, 31C and 31R will make a left turn to an initial departure heading of 140 degrees until approximately four nautical miles south of the 22L arrival traffic. Once south of the 22L arrival traffic, aircraft will turn to an east heading. When 22L arrivals are occurring, departures for runways 13L, 13C and 13R will continue straight or turn slightly right to an initial departure heading of 140 degrees until approximately four nautical miles south of the 22L arrival traffic. Once south of the 22L arrival traffic, aircraft will turn to an east heading.

Based on operating configurations today, future operation levels and future runway use, departures for the modeled Future Conditions (2013 and 2018 With Project) need to be reassigned to new INM tracks. Departures requiring reassignment by runway are highlighted in yellow in **Table 1, Eastbound Departures When Arriving 22L**. New INM departure tracks are needed for runways 13L, 13C, 13R, 22L, 22R, 31L, 31C and 31R. Departures assigned to the new INM tracks will be divided evenly amongst all new tracks for each runway. New INM tracks are depicted in **Exhibit 1, New Eastbound Departure Tracks**. When 22L arrivals are not occurring, the eastbound departures will continue to utilize the tracks from Existing Conditions (2012).

Route Criteria Failures

RSO153: The route beginning at IRK and ending at BANER has a Fly-By Fix as the last fix of the route, but does not terminates at an approach procedure.

Procedure Criteria Failures

RSO148: In the RNAV STAR Procedure, the leg from TOYUL to JEAAN's MEA (2300) is greater than the MEA (2100) previous leg (as flown).
 RSO147: In the RNAV STAR Procedure, the leg from LLVSS to MANIA's MOCA (3234) is greater than the MEA (3000) assigned to that leg.
 RSO148: In the RNAV STAR Procedure, the leg from LLVSS to MANIA's MEA (3300) is greater than the MEA (3000) previous leg (as flown).
 RSO148: In the RNAV STAR Procedure, the leg from PURTY to KOOKS's MEA (3300) is greater than the MEA (3000) previous leg (as flown).

Appendix E AIRCRAFT NOISE ANALYSIS

E.1 BASICS OF NOISE

This appendix introduces the acoustic metrics that are the relevant elements comprising the *Day-Night Average Sound Level (DNL)* noise metric, which collectively provide a basis for evaluating and understanding a broad range of noise settings.

Analysis of potential effects to the noise setting from aviation activities is conducted as directed in FAA Order 1050.1E, Appendix A, Section 14. Specifically, the FAA uses DNL to measure cumulative noise exposure from aviation activities that occur over the course of an Average Annual Day (AAD),¹ during a given year of interest. The DNL metric is built upon other fundamental concepts and metrics, which all help to analyze airport and airspace noise environments. The following sections provide essential reference material related to these technical concepts and metrics, including an introduction to fundamental acoustics and noise terminology (Section E.1.1), the effects of noise on human activity (Section E.1.2), community annoyance (Section E.1.3), and a discussion of currently accepted noise/land use compatibility guidelines (Section E.1.4).

E.1.1 Introduction to Acoustics and Noise Terminology

Noise is a complex physical quantity. Comprehension of noise exposure and the DNL metric used in environmental studies requires comprehension of the basic elements that are used to quantitatively analyze sound or noise. This chapter introduces the following acoustic metrics, all related to DNL:

- Decibel (dB)
- A-Weighted Decibel
- Maximum Sound Level ($L_{\max}$)
- Sound Exposure Level (SEL)
- Equivalent Sound Level (L_{eq})
- Day-Night Average Sound Level (DNL)

E.1.1.1 The Decibel (dB)

All sounds come from a sound source (e.g., a musical instrument, a voice speaking, or an airplane that passes overhead). It takes energy to produce sound. The sound energy produced by any sound source is transmitted through the air in sound waves – tiny, quick oscillations of pressure just above and just below atmospheric pressure. These oscillations, or sound pressures, impinge on the ear, creating the sound we hear.

Our ears are sensitive to a wide range of sound pressures but our ears are incapable of detecting small differences among these pressures. Therefore, the concept of sound pressure

¹ *Average Annual Day (AAD)* is a noise modeling metric used to normalize day-to-day variations in aviation operations over a one year period, calculated as the total number of annual operations divided by 365 (i.e., the number of days in a year).

level (SPL) is employed to better match how humans hear this sound energy, compressing the total range of sound pressures to a more meaningful range. SPL is a measurement of the sound pressure from a given noise source, compared to a standard reference value (typically the quietest sound that a young person with good hearing can detect).

SPL is measured and expressed in terms of *decibels* (dB). SPL is a logarithm of the squared ratio of two pressures, the numerator being the pressure of the sound source of interest, and the denominator being the *reference pressure* (i.e., the quietest sound we can hear). After logarithmic conversion of sound pressure to SPL, the quietest sounds we can hear (i.e., reference pressure) have SPLs of approximately zero (0) decibels, while the loudest sounds we hear without pain have SPLs of about 120 dB. Most sounds in our daily environment have SPLs from 30 to 100 dB.

Decibels are logarithmic quantities and do not compound like common numerical values. For example, if two sound sources each produce 100 dB and are operating concurrently, they would produce only 103 dB, not 200 dB as we might expect. Four equal sources at 100 dB operating simultaneously would result in a total sound pressure level of 106 dB. In fact, as the number of equal sources doubles, SPL rises only three (3) decibels.

If one source is much louder than another is, the two sources together will produce the same SPL (and sound to our ears) as if the louder source were operating alone. For example, a 100 dB source plus an 80 dB source produces 100 dB when operating together. The louder source “masks” the quieter one, but if the quieter source gets louder, it will have an increasing effect on the total SPL.

People hear SPL changes according to the following rules of thumb: 1) generally, a change of 1 dB or less in a given SPL is not readily perceptible, except in a laboratory setting; 2) a 5-dB change in a sound level is considered to be generally noticeable in a community setting; and 3) it takes approximately a 10-dB increase or decrease to be heard as a doubling or halving of a sound’s loudness, respectively.

E.1.1.2 A-Weighted Decibel

Frequency (i.e., pitch), another important characteristic of sound, is the rate of repetition of the sound pressure oscillations as they reach our ears, expressed in units known as Hertz (Hz). The human ear does not respond equally to identical noise levels at different frequencies. The normal frequency range of hearing for most people extends from a low of approximately 20 Hz to a high of 10,000 to 20,000 Hz. However, people are most sensitive to sounds in the voice range, between approximately 500 Hz to 2,000 Hz. Therefore, to correlate the amplitude of a sound with its level as perceived by people, the sound energy spectrum is adjusted, or “weighted.”

The weighting system most commonly used to correlate with human response to environmental noise is “A-weighting” (i.e., the “A-filter”) and the resultant noise level is called the A-weighted sound level. A-weighting significantly de-emphasizes those parts of the frequency spectrum from a noise source that occurs both at lower frequencies (below 500 Hz) and at very high frequencies (above 10,000 Hz) that people do not hear well. The filter has very little effect, or is nearly “flat,” in the middle range of frequencies, between 500 and 10,000 Hz. In addition to representing human hearing sensitivity, A-weighted sound levels have been found to correlate better than other weighting networks with human perception of “noisiness.” Due to its

correlation with human hearing, the A-weighted level has been adopted as the basic measure of environmental noise by the EPA, and by nearly every other Federal and state agency concerned with community noise.

E.1.1.3 Maximum A-Weighted Noise Level ($L_{\max}$)

A-weighted sound levels vary with time. For example, as an aircraft approaches, the sound level increases, then falls and blends into the background as the aircraft recedes into the distance (though even the background varies as birds chirp or the wind blows or a vehicle passes by). This variation in sound level over time often makes it convenient to describe a particular noise "event" by its maximum sound level, abbreviated as $L_{\max}$. Figure E.1-1 illustrates this concept showing an $L_{\max}$ of approximately 85 dB.

Figure E.1-1 Variations in the A-Weighted Sound Level Over Time

The maximum level describes only one dimension of an event but provides no information about cumulative noise exposure. In fact, two events with identical maxima may produce very different total exposures. One may be of very short duration, while the other may continue for an extended period and be perceived as much more annoying. To account for this deficiency, the *Sound Exposure Level* metric is used.

E.1.1.4 Sound Exposure Level (SEL)

Sound Exposure Level (SEL), the most frequently used measure of noise exposure for an individual aircraft noise event, measures the total noise energy produced during an event, from the time when the A-weighted sound level first exceeds a threshold (normally just above the background or ambient noise) to the time that it again drops below the threshold. To allow comparison of noise events with very different durations, SEL "normalizes" the duration in every case to one second. SEL is expressed as the steady noise level with just a one-second duration, which includes the same amount of noise energy as the actual longer duration, time-varying noise. In other words, SEL "squeezes" the entire noise event into one second. Figure E.1-2 depicts this transformation, with the shaded area representing the energy included in an

SEL measurement for the noise event, where the threshold is set to approximately 60 dB. The darkly shaded vertical bar, which is 90 dB high and just one second long (wide), contains exactly the same sound energy as the full event.

Figure E.1-2 Sound Exposure Level

Because the SEL is normalized to one second, its value will always be larger than the $L_{\max}$ for an event longer than one second will. In this case, the SEL is 90 dB and the $L_{\max}$ is approximately 85 dB. For most aircraft overflights, the SEL is normally approximately 7 to 12 dB higher than $L_{\max}$. Because SEL considers duration, longer exposure to relatively slow, quieter aircraft, such as propeller models, can yield the same or higher SEL values than a shorter duration exposure to faster, louder aircraft, such as corporate jets.

Aircraft noise models use SEL as the basis for computing exposure from multiple events, as in computing DNL.

E.1.1.5 Day-Night Average Sound Level (DNL)

FAA requires that airports use a more complex measurement of noise exposure than either a single, peak event metric like $L_{\max}$ or single event total noise energy metric like SEL. Neither of these metrics would adequately characterize cumulative noise exposure during an AAD, thus requiring development of the DNL noise metric. Based on the following considerations, the EPA has identified DNL as the most appropriate means² of evaluating airport noise:

1. The measure should be applicable to the evaluation of pervasive long-term noise in various defined areas, under various conditions, over long periods.
2. The measure should correlate well with known effects of the noise environment, and on individuals and the public.
3. The measure should be simple, practical, and accurate. In principal, it should be useful for planning as well as for enforcement or monitoring purposes.

² EPA, "Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety," Report No. 550/9-74-004, March 1974.

4. The required measurement equipment, with standard characteristics, should be commercially available.
5. The measure should be closely related to existing methods currently in use.
6. The single measure of noise at a given location should be predictable, within an acceptable tolerance, from knowledge of the physical events producing the noise.
7. The measure should lend itself to small, simple monitors, which can be left unattended in public areas for long periods.

The FAA and most other Federal agencies have formally adopted DNL when evaluating effects (primarily community annoyance) from aircraft operations in or near an airport.

The DNL metric represents noise as it occurs over a 24-hour period, with one important exception: DNL treats noise occurring at night differently from daytime noise. In determining DNL, the metric assumes that the A-weighted levels occurring at night (defined as 10 p.m. to 7 a.m.) are 10 dB louder than they actually are. This 10 dB increase is applied to account for the fact that there is a greater sensitivity to nighttime noise, and the fact that events at night are often perceived to be more intrusive because nighttime ambient noise is less than daytime ambient noise.

The manner by which these metrics build upon each other is illustrated in Figure E.1-3. A single event, peak ($L_{\max}$ or instantaneous) sound pressure level is transformed into a noise exposure metric (SEL) that accounts for and allows comparison of the magnitude and duration of the event by describing it in terms of energy over a constant duration (1 second). Figure E.1-1 illustrates changes to A-weighted sound level occurring during a single aircraft overflight event, repeated in the top frame of Figure E.1-3. The shaded area reflects the noise dose that a listener receives during the one-minute period of the sample. The center frame of Figure E.1-3 includes this one-minute sample within a full hour. The shaded area represents the noise during that hour with sixteen (16) discrete noise events, each producing a SEL. Similarly, the bottom frame includes the one-hour interval within a full 24 hours. Here, the shaded area represents the listener's noise dose over a complete day. Note that several overflights occur when the background noise drops some 10 dB, to approximately 45 dB

Figure E.1-3 Daily Noise Dose

While DNL can be measured or estimated, measurements are practical only for obtaining DNL values for relatively limited numbers of points, and, in the absence of a permanently installed monitoring system, only for relatively short time periods. Most airport and airspace noise studies are based on computer-generated DNL estimates, determined by accounting for all of the SEL values from individual events that comprise the total noise dose at a given location. Computed DNL values are often depicted in terms of equal-exposure noise contours (much as topographic maps have contours delineating points of equal elevation), or by color-coded grid points representing population centroids, specific noise sensitive sites (e.g., schools or places of worship), or non-specific but uniform coverage of a large study area. Figure E.1-4 depicts typical DNL values for a variety of noise environments.

Figure E.1-4 Examples of Day-Night Average Sound Levels, DNL³

³ EPA, "Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety," p. 14, March 1974.

E.1.2 The Effects of Aircraft Noise on People

To residents around airports, aircraft noise can be an annoyance and a nuisance. It can interfere with conversation and listening to television, disrupt classroom activities in schools, and disrupt sleep. Relating these effects to specific noise metrics helps in the understanding of how and why people react to their environment.

E.1.2.1 Speech Interference

A primary effect of aircraft noise is its tendency to drown out or "mask" speech, making it difficult to carry on a normal conversation. The sound level of speech decreases as the distance between a talker and listener increases. As the background sound level increases, it becomes harder to hear speech. Figure E.1-5 presents typical distances between talker and listener for satisfactory outdoor conversations, in the presence of different steady A-weighted background noise levels for raised, normal, and relaxed voice effort. As the background level increases, the talker must raise his/her voice, or the individuals must move closer for improved intelligibility.

As indicated in the figure, "satisfactory conversation" does not always require hearing every word; 95 percent intelligibility is acceptable for many conversations. Listeners can infer a few unheard words when they occur in a familiar context. However, in relaxed conversation, we have higher expectations of hearing speech and generally require closer to 100 percent intelligibility. Any combination of talker-listener distances and background noise that falls below

⁴ EPA, "Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety," p. D-5, March 1974.

the bottom line in Figure E.1-5 (thus assuring 100% intelligibility) represents an ideal environment for outdoor speech communication and is considered necessary for acceptable indoor conversation as well.

One implication of the relationships in Figure E.1-5 is that for typical communication distances of 3 to 4 ft. (1 to 1.5 m), acceptable outdoor conversations can be carried on in a normal voice as long as the background noise outdoors is less than about 65 dB. If the noise exceeds this level, as might occur when an aircraft passes overhead, intelligibility would be lost unless vocal effort were increased or communication distance were decreased.

Indoors, typical distances, voice levels, and intelligibility expectations generally require a background level less than 45 dB. With windows partly open, housing generally provides approximately 10 to 15 dB of interior-to-exterior noise level reduction. Thus, if the outdoor sound level is 60 dB or less, there is a reasonable chance that the resulting indoor sound level will afford acceptable conversation. With windows closed, 24 dB of attenuation is typical.

E.1.2.2 Sleep Interference

Research on sleep disruption from noise has led to widely varying observations. In part, this is because (1) sleep can be disturbed without awakening; (2) the deeper the sleep the more noise it takes to cause arousal; and (3) the tendency to awaken increases with age, and other factors. Figure E.1-6 shows a recent summary of findings on the topic.

Figure E.1-6 uses indoor SEL as the measure of noise exposure as recent research supports the use of this metric in assessing sleep disruption. An indoor SEL of 80 dB results in a maximum of 10% awakening.

⁵ Federal Interagency Committee on Aviation Noise (FICAN), “Effects of Aviation Noise on Awakenings from Sleep,” p. 6, June 1997.

E.1.3 Community Annoyance

Numerous psychoacoustic surveys provide substantial evidence that individual reactions to noise vary widely for a given noise exposure level. However, research has confirmed that a community's aggregate response is generally predictable and relates reasonably well to measures of cumulative noise exposure such as DNL. Figure E.1-7 shows the widely recognized relationship between environmental noise and the percentage of people "highly annoyed," with annoyance being the key indicator of community response usually cited in this body of research.

Figure E.1-7 Percentage of People "Highly Annoyed"⁶

Based on data from 18 surveys conducted worldwide, the curve indicates that at levels as low as DNL 55 dB, something on the order of 3 to 4 percent of people would be "highly annoyed," whereas this percentage of persons annoyed increases more rapidly as exposure increases above DNL 65 dB.

Separate work by the EPA has shown that overall community reaction to a noise environment is also dependent on DNL, as depicted in Figure E.1-8. Levels have been normalized to the same set of exposure conditions to permit valid comparisons between ambient noise environments. Data summarized in that figure suggest that little reaction would be expected for intrusive noise levels 5 dB below ambient, while widespread complaints can be expected as intruding noise exceeds background levels by about five decibels. Vigorous action is likely when the background is exceeded by 20 dB.

⁶ FICAN, "Federal Agency Review of Selected Airport Noise Analysis Issues," pp. 3-6, August 1992; applied using data provided by USAF Armstrong Laboratory.

Figure E.1-8 Community Reaction as a Function of Outdoor DNL⁷

E.1.4 Noise/Land Use Compatibility Guidelines

The FAA, other Federal agencies, and several states have developed guidelines for identifying land use compatibility – for more noise-sensitive land use, noise exposure should be lower in order to achieve compatibility. Thus, DNL serves two principal purposes for aviation noise analysis:

- Provides a basis for comparing existing and future noise conditions
- Provides a quantitative basis for identifying potential noise impacts

Both of these functions require the application of objective criteria for evaluating noise impacts. *Code of Federal Regulations*, Title 14, Part 150 provides the FAA's recommended guidelines for determining noise/land use compatibility. According to these FAA guidelines, all identified land uses – even those that are more noise sensitive – normally are compatible with aircraft noise at DNL levels below 65 dB. The significance of this level is formally supported in standards adopted by the U. S. Department of Housing and Urban Development (HUD). *Code of Federal Regulations*, Title 24, Part 51 indicates that areas exposed to DNL levels less than or equal to 65 dB are acceptable for HUD funding. Areas exposed to noise levels between DNL 65 dB and 75 dB are "normally unacceptable," and require special abatement measures and review. Those at DNL 75 dB and above are "unacceptable" except under very limited circumstances.

⁷ EPA, Office of Noise Abatement and Control, "Community Noise," p. 63, December 1971, prepared by Wyle Laboratories.

E.2 INTEGRATED NOISE MODEL (INM) TECHNICAL REPORT

The same noise metric and noise model was used to compute all noise exposure contours and other evaluations prepared for this Part 150 Study Update for Chicago Midway International Airport (MDW).

E.2.1 Noise Metric

The FAA has stipulated that noise exposure maps (NEMs) prepared for Part 150 studies will be based on the annual DNL. This noise metric was developed under the auspices of the USEPA and embodies extensive information regarding the physical description of transportation noise as related to human annoyance in residential areas. DNL is defined as the average A-weighted sound level during a 24-hour period with a 10 dB penalty applied to noise events that occur at night (10:00 p.m. to 6:59 a.m.). Noise exposure contours are lines connecting points of equal noise level; for this Part 150 study, these levels are 65 DNL, 70 DNL, and 75 DNL.

E.2.2 Noise Model

The noise levels were computed during this study using Version 7.0c of the Integrated Noise Model (INM). The INM was developed under the guidance of the FAA and is the only model generally approved by the FAA for use in Part 150 studies. The noise pattern calculated by the INM for an airport is a function of several factors, including; the number of aircraft operations during the period evaluated, the types of aircraft flown, the time of day when they are flown, the way they are flown, how frequently each runway is used for landing and takeoff, and the routes of flight used to and from the runways. Substantial variations in any one of these factors, when extended over a long period of time, may cause marked changes to the noise pattern.

E.2.3 Comparability of Conditions

Noise evaluations for the Existing (2012) condition of this Part 150 Study are based on actual operating levels at MDW during the 2011 calendar year. Data representative of an average-annual day of operations were developed from the CDA's Airport Noise Management System (ANMS). This data included the number of arrival and departure operations by individual types of aircraft during daytime and nighttime periods, the distribution of aircraft activities among the runway ends, and the distribution of aircraft along the flight paths leading to or from each runway. The current year NEM is labeled 2012 and is based on data collection and analysis which began in 2011.

The total annual operations on which the Existing Conditions (2012) NEM is based is 257,800. The FAA's January 2012 Terminal Area Forecast (TAF) projects 260,157 annual operations for the calendar year 2012, which is a difference of less than one percent from the actual calendar year 2011 data. In addition, no notable changes in aircraft fleet mix occurred between 2011 and 2012. Therefore, the data on which the 2012 NEM is based is reflective of actual conditions in 2012.

Per 14 CFR Part 150 requirements, the future noise contour on the official NEMs are to be dated at least five years after the date of submission. Since the FAA developed future flight procedure assumptions for the year 2018, the future noise contour for the MDW Part 150 is 2018 (six years after the date of submission).

The Future (2018) noise exposure contour is based upon the 2012 noise contour, the FAA's 2012 Terminal Area Forecast (TAF), new flight procedures proposed by the FAA, the utilization of the new flight procedures developed by the FAA, future runway use changes developed by the FAA and fleet mix assumptions developed by the FAA. The TAF was based upon information regarding aviation industry trends and specific airline activity at MDW that was available at the time. The 2012 TAF was the most current FAA forecast that was available at the time noise modeling began. Table E.2-2 shows the 2012 TAF.

E.2.4 Noise Modeling Input Data

Several types of operational information are required to produce noise exposure patterns for an airport. These include estimates of the numbers of actual operations by specific aircraft types at different periods of the day, flight path locations, runway and flight path utilization, and aircraft operating characteristics.

E.2.4.1 Number of Operations

The total annual operations on which the Existing Conditions (2012) NEM is based is 257,800. Table E.2-1 shows the number of aircraft by category estimated to operate at MDW during the Existing (2012) and Future (2018) years.

The total number of operations for the Future Conditions (2018) was derived from the FAA Terminal Area Forecast (TAF) of 298,650. Table E.2-1 also presents the average daily numbers of aircraft operations (calculated by dividing the annual total by 365 days) for the categories of aircraft operating at MDW.

Table E.2-1 Midway Airport Summary of Modeled Annual Operations

Aircraft Category	Annual		Average Day		Percent	
	2012	2018	2012	2018	2012	2018
Passenger	197,672	231,903	542	635	76.7%	77.7%

E.2.4.2 Day-Night Distribution

The time of day that operations (i.e. both arrivals and departures) occur is also a key component of the INM input. It is important to the computation of the cumulative average noise level because a penalty of ten decibels is assigned to each operation that occurs at night (between the hours of 10:00 p.m. and 6:59 a.m.). The distribution between daytime and nighttime was developed for each individual aircraft type and operation type based on the radar data from the Airport Noise Management System. On an average day in 2011, approximately 9% of aviation traffic operating at MDW occurred during the nighttime hours (10:00 p.m. to 6:59 a.m.). The Day-Night splits developed from the data sample were used for the Existing (2012) as well as the Future (2018) noise exposure contours. Table E.2-3 presents a summary of the Day-Night percentages used for noise modeling for each operational category at MDW.

Table E.2-3 Midway Airport Summary of Day-Night Operational Distributions

Aircraft Category	Arrivals		Departures	
	Day	Night	Day	Night
Passenger	90%	10%	92%	8%
GA	90%	10%	92%	8%
Military	100%	0%	100%	0%

Note: Day = 7:00 a.m. to 9:59 p.m., Night = 10:00 p.m. to 6:59 a.m.
Source: CDA, "2013 Part 150 Study Update"

E.2.4.3 Aircraft Fleet Mix

The distribution of the operations (i.e. both arrivals and departures) among the many types of aircraft available within the INM database is another important component of the INM input data. The distribution among types for this analysis was based on actual radar data from the CDA's Airport Noise Management System (ANMS). The ANMS data provided actual aircraft types operating at Midway. The average daily operations by aircraft type for MDW is presented in Table E.2-4. The table presents the average daily operations by aircraft type for day and night, the INM type, and by fleet mix percentage. The majority of the fleet mix at the airport is expected to essentially remain unchanged over the five-year period through 2018.

E.2.4.4 Runway Utilization

The usage of the runways at the airport is another principal element in the definition of the noise exposure pattern. Generally, the primary factor determining runway use at an airport is the weather and prevailing wind conditions at the time of a flight.

The INM uses runway utilization to distribute aircraft onto the correct runway end by type of operation (arrival or departure). This distribution for Existing Conditions (2012) was developed based on radar data from the Airport Noise Management System. The distribution for Future Conditions (2018) was provided by the FAA and based on future levels of activity, aircraft fleet mix, and usage of new arrival procedures. Tables D-5 and D-6, Runway Use - *Existing (2012)* & *Future (2018)*, respectively, illustrate a summary of the overall runway use modeled.

E.2.4.5 Flight Track Locations and Use

To determine projected noise levels on the ground, it is necessary to determine not only how many aircraft are present, but also the route along which they fly. Therefore, flight route information is a key element of the INM input data. In order to ensure that the INM modeling accurately reflects local conditions in the Chicago area it is necessary to develop noise modeling tracks from a sample of detailed radar data. A twelve-month sample of radar flight track data was acquired and analyzed for traffic into and out of MDW. The sample included the months of January through December of 2011. This sampling provides 365 days of data, including some 125,000+ arrival tracks and 125,000+ departure tracks, and is distributed throughout the year to cover any seasonal differences in weather or flight conditions. This detailed information allowed for the development of an exhaustive and rigorous database of flight tracks for the noise modeling effort.

Noise modeling tracks were developed for Existing Conditions (2012) by a detailed analysis of 2011 radar data. The data was separated first by operation type (i.e., arrival, departure) and then by aircraft type and runway. Primary flight corridors were identified then used to develop bundles of radar tracks based on runway, aircraft category (i.e., jet, prop), and route similarity. Once the radar track bundles were complete, the development of noise modeling input tracks in the INM was initiated.

Development of primary, or backbone, flight tracks for each radar track bundle was created along with simultaneous computation of sub-tracks that are located adjacent to the backbone track. These sub-tracks account for the dispersion of actual flights along the primary flight corridor based on the distribution of radar tracks within each bundle. Once the number of sub-tracks is determined, the distributional factors in combination with the statistical lateral distribution of the radar tracks at many locations along the flight corridor are used to determine the appropriate spacing between the sub-tracks at each location. The number of sub-tracks and the distributional factors associated with each model track are chosen by the user based on the number of radar tracks in the bundle and their general spread throughout the route.

The development of noise model flight tracks resulted in the creation of 245 backbone departure tracks representing the primary flight corridors and geometry from all of the runways at MDW. These backbone tracks also included 956 sub-tracks to account for the typical flight dispersion along the corridors. Consequently, 1,201 unique departure flight tracks were input into the INM to represent the flight paths from MDW. Similarly, the analysis of the arrival radar tracks resulted in the development of 212 backbone arrival tracks for the runways at MDW. These backbones were supplemented with 604 sub-tracks to account for the dispersion of arrival flights in the primary corridors for each runway. Thus, more than 816 arrival tracks were input into the INM for the MDW noise contour modeling.

In some cases, it may seem the INM tracks are more extensive than that of a typical day of actual flight tracks, but the INM tracks are based on the entire calendar year of 2011 and incorporate the long-term variations in dispersion that are not always evident in a single day of radar data. Also, it should be noted that the INM tracks may represent a fraction of a flight where traffic is relatively sparse or multiple flights where traffic is denser.

During the course of the preparation of this study, the FAA was in the process of developing new flight procedures for MDW. These procedures consisted of new Area Navigation (RNAV) and Required Navigational Performance (RNP) approaches into runways 04R, 13C, 22L and 31C. As part of this effort, future runway use, fleet mix and use of the new and conventional procedures were also developed by the FAA. Future runway use is shown in Table E.2-6 and utilization of the new procedures is detailed in Table E.2-7.

RNAV and RNP procedures are generally either departure or arrival procedures that are defined based on two or three dimensional points rather than ground-based navigational aids. This allows for flexibility in route design as well as leveraging newer technology such as satellite-based navigation. The RNP procedures add an extra dimension of precision using an onboard performance monitoring and alerting capability. A defining characteristic of RNP operations is the ability of the aircraft navigation system to monitor the navigation performance it achieves and inform the crew if the requirement is not met during an operation. This onboard monitoring and alerting capability enhances the pilot's situational awareness and can enable reduced obstacle clearance or closer route spacing without intervention by air traffic control. The practical effect of RNP procedures is that routes are generally flown more precisely with significantly less dispersion along flight tracks depending on the degree of precision specified by the RNP procedure.

In addition to new advanced arrival procedures, the new future 22L arrival procedures will impact eastbound departures for runways 13L, 13C, 13R, 22L, 22R, 31L, 31C and 31R. This will only occur while aircraft are arriving runway 22L. When 22L arrivals are not occurring, eastbound departures will continue to operate as they do today.

When 22L arrivals are occurring, departures for runways 22L, 22R, 31L, 31C and 31R will make a left turn to an initial departure heading of 140 degrees until approximately four nautical miles south of the 22L arrival traffic. Once south of the 22L arrival traffic, aircraft will turn to an east heading. When 22L arrivals are occurring, departures for runways 13L, 13C and 13R will continue straight or turn slightly right to an initial departure heading of 140 degrees until approximately four nautical miles south of the 22L arrival traffic. Once south of the 22L arrival traffic, aircraft will turn to an east heading. New INM departure tracks were created to reflect this change.

Notes:

- Based on an Annual Average Day (AAD) of the Existing Conditions (2012).
- Based on an Annual Average Day (AAD) of the Total Annual Operations of 298,650, FAA's Terminal Area Forecast (TAF), January 2012, FAA runway utilization forecast, July 2012 and procedure utilization in above table.
- Consists of existing flights paths with the exception of the existing 13C RNP.
 - Year 2018 percentages for SWA are based on a 2% increase from Year 2013.
 - SWA Fleet: B737-700 & B737-800 are 100% RNP & GPS; B737-300 are 5% RNP & GPS and B737-500 are 50% RNP & GPS equipped.
 - SWA will reduce the B737-300 to 1% of their operations at MDW in 2018; B737-700 and B737-800 will increase proportionally.
 - Other Fleet: CLREGJ, CRJ701, CRJ900, EMB145, EMB170, CL601, CNA441, CNA500, CNA55B, CNA650, CNA750, GIV, GV, LEAR35, MU3001.
 - GA represents the following aircraft: CNA441, CNA500, CNA55B, CNA650, CNA750, GIV, GV and LEAR35.
 - Operations for runways 04L, 13L, 13R, 22R, 31L and 31R are not shown.
 - New STAR Procedures (ENDEE, FISSK, GARFIELD and GOSHEN) are not shown.

Tables E.2-8 and E.2-9 provide the arrival and departure flight track utilization percentages modeled for the Existing (2012) conditions and Future (2018) conditions.

Table E.2-8 Midway Airport Arrival Flight Track Utilization by Aircraft Category – Existing (2012) and Future (2018) Conditions

Source: CDA, "2013 Part 150 Study Update"

Based on operating configurations in 2012, future operation levels and future runway use, departure track utilization for the modeled Future Conditions (2018) reflects the eastbound departures changes. Table E.2-10 lists the AAD operations that were reassigned to the new departure INM tracks. All remaining eastbound departures will continue to utilize the tracks from Existing Conditions (2012).

Table E.2-10 Midway Airport Eastbound Departures Reassigned to New INM Tracks – Future Conditions (2018)

E.2.4.6 Aircraft Weight and Trip Length

Aircraft weight during departure is a factor in the dispersion of noise because it impacts the rate at which an aircraft is able to climb. Generally, the heavier the aircraft, the slower the rate of climb and the distribution of noise along its route of flight tends to be larger. Where specific aircraft weights are unknown, the INM uses the distance flown to the first stop as a surrogate for the weight, by assuming that the weight has a direct relationship with the fuel load necessary to reach the first destination. The INM groups trip lengths into nine stage length categories, and assigns various aircraft weights associated with up to all nine categories, shown in Table E.2-11.

Table E.2-11 INM Stage Length Categories

Category	Stage Length
1	0-500 nautical miles
2	500-1000 nautical miles
3	1000-1500 nautical miles
4	1500-2500 nautical miles
5	2500-3500 nautical miles
6	3500-4500 nautical miles
7	4500-5500 nautical miles
8	5500-6500 nautical miles
9	6500+ nautical miles

The trip lengths flown from MDW for the Existing (2012) and Future (2018) conditions are based on the destination field provided in the radar data from the ANMS and on the scheduled operations. Due to the lengths of the Midway runways and the nature of operations and aircraft operating at Midway, the majority of the trip lengths are less than 1,000 nautical miles, and represents the major proportion of the operations that are assumed to fall within each of the trip length categories used for both Existing (2012) and Future (2018) operation levels. Table E.2-10 indicates the proportion of the operations that fell within each of the seven trip length categories for both the Existing (2012) and the Future (2018) operation levels.

Table E.2-12 Midway Airport Departure Trip Length Distribution – Existing (2012) and Future (2018) Conditions

Stage Length	Passenger	General Aviation
1	80%	100%
2	20%	0%
3	0%	0%
4	0%	0%
5	0%	0%
6	0%	0%
7	0%	0%

E.2.4.7 Terrain Elevation Data

Terrain elevation data was used in the noise modeling process in order to adjust observer-to-aircraft distances when computing noise levels. The terrain data describes the elevation of the ground surrounding the airport and on airport property. The terrain elevation data used in INM was obtained from the United States Geological Survey (USGS) at 1/3 arc second resolution in a National Elevation Dataset (NED) Gridfloat format. GridFloat is a non-proprietary binary data format.

MEMORANDUM

To: Nan L. Terry
Environmental & Airspace Specialist
FAA, ATO Central Service Center
Operations Support Group AJV-C23

From: Vinnie Khera
Contractor Project Manager (Chicago Midway International Airport
Air Traffic Procedural Changes - Environmental Assessment)

Date: February 16, 2013

Subject: Methodology for the Analysis of Change of Exposure at Noise
Sensitive Areas in Vicinity of Chicago Midway International Airport
(MDW).

Reference: Chicago Midway International Airport Air Traffic Procedural
Changes – Environmental Assessment
Contract No. DTFAWA-10-A-00209, Order No. 002
HMMH Job No.304050.002

Harris Miller Miller & Hanson Inc. (HMMH) is preparing an Environmental Assessment (EA) for Air Traffic Procedural Changes at Chicago Midway International Airport (MDW). This memorandum describes how HMMH utilized Integrated Noise Model (INM) case files furnished by the Federal Aviation Administration (FAA) to analyze change of exposure levels to aircraft noise that would change at noise sensitive areas (i.e., population, residences, schools, parks, and historic sites).

Concurrent with the development of the EA, the City of Chicago, Department of Aviation (CDA) is preparing an update to its Part 150 Study (*2013 Part 150 Study Update*). The 2012 baseline noise setting described in that document and shown on Exhibit NEM-1 forms the baseline noise setting for the EA in Chapter 4 – *Affected Environment*. The *2013 Part 150 Study Update* analyzed two scenarios in addition: a Future Conditions (2018) and a Future Conditions (2018 Alternative – A). The former scenario is identical to the Proposed Action (2018) in the EA and the latter is identical to the No Action (2018).

The *2013 Part 150 Study Update* report and associated noise modeling were developed by Landrum & Brown (L&B) and used INM to model the area in the immediate vicinity of MDW. The methodology described below was employed for areas within the DNL 65 dB (and higher) noise exposure contours, referred to herein and in the Environmental Assessment, as the “airport environs.” Areas outside the DNL 65 dB noise exposure contour were developed by HMMH using the Noise Integrated Routing System (NIRS) aircraft noise model and are not included in this methodology.

For the EA, noise impacts on population, housing, and noise sensitive sites were accomplished using the following data:

- U.S. Census Bureau 2010 block centroid points for potential impacts to population;
- MDW Residential Data points from the Draft Part 150 study developed by Landrum & Brown;
- MDW noise sensitive data points from the Draft Part 150 study developed by Landrum & Brown;

HARRIS MILLER MILLER & HANSON INC.

Chicago Midway International Airport Air Traffic Procedural Changes – Environmental Assessment

Page 2

- MDW Part 150 noise contours for 2013 developed by Landrum & Brown; and
- INM inputs developed by Landrum & Brown.

Analysis of the data was accomplished using GIS, INM, and Microsoft Access database software to determine points to be analyzed in detail. INM case files representing five scenarios were prepared by Landrum and Brown:

- A baseline 2012 scenario;
- A 2013 Future Conditions (With Project) representing the 2013 Proposed Action in the EA;
- A 2013 Future Conditions (Without Project) representing the 2013 No Action in the EA;
- A 2018 Future Conditions (With Project) representing the 2018 Proposed Action in the EA;
- A 2018 Future Conditions (Without Project) representing the 2013 No Action in the EA;

These case files were run in INM to calculate noise, with the DNL metric, at uniform grid points, population census block points, and noise sensitive locations from the data sources described above. The results are reported in summarized form in Chapter 5 of the EA.

**Methodology for the Analysis of Potential Impacts to Population, Housing, and Noise Sensitive Sites
for the MDW Air Traffic Procedural Changes Environmental Assessment (EA) Using the 2013 DNL Noise
Contours Developed in the MDW Part 150 Noise Study**

Prepared by URS Corporation

February 15, 2013

This memorandum describes how URS Corporation utilized noise exposure contours derived from the Midway International Airport (MDW) Part 150 Noise Compatibility Study for the analysis of aircraft noise level changes on population, housing, noise sensitive sites, and compatible land use. The 2013 noise exposure contours¹ were developed by Landrum & Brown, the firm that prepared the Draft MDW Part 150 Study, using the FAA's Integrated Noise Model (INM). The methodology described below was employed for areas within the DNL 65 dBA (and higher) noise exposure contours, referred to herein and in the Environmental Assessment, as the "airport environs." Areas outside the DNL 65 dBA noise exposure contour were developed by HMMH using the NIRS noise model and are not included in this methodology.

For the EA, noise impacts on population, housing, and noise sensitive sites were accomplished using the following data:

- U.S. Census Bureau 2010 block centroid points for potential impacts to population;
- MDW Residential Data points from the Draft Part 150 study developed by Landrum & Brown;
- MDW noise sensitive data points from the Draft Part 150 study developed by Landrum & Brown;
- MDW Part 150 noise contours for 2013 developed by Landrum & Brown; and
- INM inputs developed by Landrum & Brown.

Analysis of the data was accomplished using GIS, INM, and Microsoft Access database software. The following procedure was used to generate results for 2013 noise impacts:

- The Draft MDW Part 150 noise contours for 2013 were used by URS in the GIS environment (ESRI ArcGIS) to identify and select all data points that were located within the 2013 No-Action and Proposed Action DNL +65 dBA noise exposure contours;
- Using INM, the selected data points were modeled by HMMH for the purpose of calculating noise exposure levels at each selected point for the 2013 No-Action and Proposed Action scenarios; and
- The results data from the INM modeling were imported into Microsoft Access where the data was sorted, queried, and summarized to provide values for impacts on population, housing, and noise sensitive sites. This information was used to develop EA Tables 5.4.3-1 and 5.4.3-2.

As described above, the impact analyses were based on discrete point data developed in conjunction with the EA and the Part 150 studies. Using the GIS, data points were selected for inclusion in the INM modeling if they fell on or within the 2013 noise exposure contours. All population, housing, and noise sensitive site points that were found to have a noise exposure level equal to or greater than DNL 65 dBA

¹ Because similar analyses were performed by Landrum & Brown for the 2018 study year as part of the MDW Part 150 study, those results were used in the EA for reporting the potential impacts for the 2018 study year.

were sorted into three categories base on DNL noise exposure range of: DNL +75, 70 to 75, and 65 to 70 dBA. Population estimates for noise exposure were derived by evaluating projected noise levels (with and without project) at each of the selected population centroids and calculating the number of people associated with each population centroid using US Census block data. The number of housing units within each noise exposure range was determined by evaluating projected noise levels (with and without project) at each of the selected housing data points from the MDW Residential Data file. This data file included basic information on residential structure type and whether the structures had received noise mitigation treatment or its present status within the MDW noise mitigation program, if eligible. Noise sensitive sites, such as schools, churches, libraries, hospitals, and day care centers, were identified with their own discrete data points. These data points were analyzed using the same methodology as described for the population and housing points.

The data and calculations, at each stage of the analysis process, were subjected to various quality control measures. These measures included cross checks and consistency checks of the data and calculations between the GIS, Access database, and INM. Also, where practical, visual checks of the data were performed using up to date aerial photography contained in the GIS.

E.3 NOISE INTEGRATED ROUTING SYSTEM (NIRS) TECHNICAL REPORT

E.3.1 Noise Modeling Methodology and Data Inputs

FAA Order 1015.1E specifies that one of three noise models, FAA's Integrated Noise Model (INM), its Heliport Noise Model (HNM), or its Noise Integrated Routing System (NIRS), should be used for an Environmental Assessment.⁸ NIRS is typically used for flight track changes over large areas and at altitudes over 3,000 ft. AGL. For the MDW EA analysis, NIRS provided an advantage compared to INM outside the MDW Environ. Therefore, NIRS Version 7.0b.2 was selected for evaluations beyond the immediate airport vicinity.⁹

Additionally, FAA Order 1050.1E specifies that analysis for the EA should be done with the yearly Day-Night Average Sound Level (DNL) noise metric. In accordance with FAA Order 1050.1E, this analysis considers the noise exposure for the following nine (9) scenarios:

- Existing Conditions (2012)
- First year of proposed implementation (2013) – No Action
- Five years after proposed implementation (2018) – No Action
- First year of proposed implementation (2013) – Proposed Action
- Five years after proposed implementation (2018) – Proposed Action

The 2013 Proposed Action noise results were compared to the 2013 No Action Alternative to determine any changes in noise levels that would meet or exceed the FAA criteria for significance or reportable occurrences.¹⁰ Likewise, the 2018 Proposed Action noise results were compared to the 2018 No Action Alternative and evaluated against these criteria.

NIRS requires inputs from several data source types, including the following:

- Routes and events for each scenario
- Airport and runway locations
- Annualization weights for each traffic component of each scenario
- Additional population locations for calculation of DNL
- Additional grids for calculation of DNL
- Additional Noise Sensitive sites for calculation of DNL
- Geographic areas

⁸ FAA order 1050.1E Change 1, Appendix A, Section 14.2b. Other methodology and computer models can be used with prior written approval from the FAA Office of Environment and Energy (AEE).

⁹ FAA released NIRS Version 7.0b.2 on March 2, 2012. This was the most current version of NIRS at the time of the noise analysis.

¹⁰ FAA Order 1050.1E, Chg. 1, Appendix A, Section 14.3, sec. 14.4, and 14.5e.

- Terrain files

Data for the MDW EA came from various sources and were used for many of the input categories discussed above. Several of the primary sources of data are listed below, while additional sources are later discussed as appropriate:

- CDA “2013 Part 150 Noise Study Update” for MDW – This included an INM study representing existing conditions (2012) and future conditions (2013 and 2018), with associated flight tracks, noise location modeling grid points, terrain data, and a high-level operations summary.
- Radar Data – HMMH obtained data for eighty-five (85) 24-hour periods from January 1, 2011 to November 19, 2011
- Interviews – HMMH had discussions with personnel at the airport, particularly flight tower operators regarding activity and traffic flow at the airport.

HMMH’s assumptions and data collection processes for each of these items are discussed below.

E.3.2 Study Area

To determine the bounds of the study for this EA, the FAA considered the geographic areas where new or revised aircraft procedures under the Proposed Action would differ from the No Action Alternative. The FAA evaluated the existing flight tracks in the MDW region as a basis for determining the areas in which the Proposed Action changes are likely to occur. As an initial step, the FAA collected radar data for arrival and departure operations from MDW during 2010-2011, focusing specifically on aircraft traffic within the ZAU ARTCC and the C90 TRACON. The National Offload Program (NOP) was used to gather representative radar data specific to the region for eighty-five (85) 24-hour periods from January 1, 2011 to November 19, 2011, providing an accurate representation of overall annual conditions.

E.3.2.1 Methodology to Determine the Study Area

The study area is a three-dimensional block of airspace designed to capture aircraft operations to and from MDW that operate below 10,000 ft. AGL. The top elevation of the study area is defined by an altitude of 10,000 ft. AGL, and the lateral dimension is defined by the point at which departing aircraft penetrate the 10,000 ft. AGL altitude, based on analysis of historical radar data. Applying these criteria, the study area captures the maximum range of flight tracks where 95 percent of aircraft pass through the 10,000 ft. AGL ceiling.

The FAA analyzed the collected radar data for airport jet aircraft approaching and departing from MDW and operating under IFR. A review of radar data showed that approximately 95 percent of MDW jet aircraft operations below 10,000 ft. AGL occur within approximately 55 NM of MDW. However, given the presence of O’Hare airport to the north, and the fact that aircraft operating to or from MDW generally do not depart or arrive from the north side of MDW, the study area polygon was adjusted accordingly.

To facilitate analysis of aircraft overflight operations that may potentially affect national parks and wildlife refuges administered the Department of Interior (DOI), an examination of the same radar data was undertaken for IFR operations occurring below 18,000 ft. AGL. This analysis

determined that slightly expanding the geographic extent of the study area identified for aircraft operations at 10,000 ft. AGL would capture the same properties. Therefore, the study area was extended slightly westward.

E.3.2.2 Setting and Location

The study area encompasses 10,402 sq. mi., 32 counties in part or whole, and portions of three states, with the following dimensions: 145.4 NM east to west along the south boundary, 78.3 NM east to west along the north boundary, and 60.1 NM north to south. Four airports were important for analysis of the MDW study area due to their contribution to the overall noise environment: Aurora Municipal Airport (ARR), DuPage Airport (DPA), Gary Chicago International Airport (GYY), and O'Hare International Airport (ORD), which impacts the noise environment around MDW along with other overflight activity. Please refer to Figure 10 in Section 4.2 for a graphical depiction of the study area. Table E.3-1 lists the counties in the study area.

Table E.3-1 Study Area Counties

Illinois				
Bureau	Cook	DeKalb	DuPage	Ford
Ford	Grundy	Iroquois	Kane	Kankakee
Kendall	LaSalle	Lee	Livingston	Marshall
Peoria	Putnam	Will	Woodford	
Indiana				
Cass	Fulton	Jasper	Lake	LaPorte

E.3.3 Airport Layout

The layout of an airfield is an important modeling input. Accurate runway information places modeled flights in the correct locations. Elevation data allow NIRS to calculate runway gradients, which influence modeled take-off roll and landing distance. Runway information for MDW, including runway end locations, elevations, width, and length, as well as the location and elevation of the airport reference point, were obtained from the FAA confirmed with the CDA "2013 Part 150 Noise Study Update." Table E.3-2 presents runway information for MDW and Figure E.3-1 shows the FAA airport Diagram for MDW.

Table E.3-2 Midway Airport Runway Information

Runway End	Latitude (decimal degrees)	Longitude (decimal degrees)	Elevation (ft. MSL)	Width (ft.)	Length (ft.)
04L	41.781366	-87.761192	618.2	150	5509

Diagram

E.3.4 Aircraft Operations

NIRS requires users to assign a specific aircraft type to each operation from its standard database. Operations data for each of the three study years (2012, 2013, and 2018) derived from the CDA “2013 Part 150 Noise Study Update” and the FAA Terminal Area Forecast (TAF) database. Table E.3-3 presents the annual aircraft operations for three operations categories: (1) Jets, (2) Turbo-Prop aircraft, and (3) Propeller aircraft. Operations remain the same for the No Action and Proposed Action forecast years.

Table E.3-3 Summary of Operations

Airport	Operations Category	2012	2013	2018
MDW	Jet	211,787	223,007	251,577
	Turbo-Prop	8,647	9,440	10,787
	Prop	30,639	32,820	36,270
	Total	251,072	265,267	298,634

	Turbo-Prop	90	90	90
	Prop	1,378	1,378	1,378
	Total	4,140	4,140	4,140
Note: 1. ORD operations for this table only include operations overflying MDW study area below 10,000 ft., not all operations at ORD. Source: CDA, “2013 Part 150 Noise Study Update”; FAA TAF				

E.3.4.1 Aircraft Noise Performance

Specific noise and performance data must be entered into NIRS for each aircraft type operating at the airport. Noise data is included in the form of sound exposure level (SEL) at a range of distances from a particular aircraft with engines at a specific thrust level. Performance data includes thrust, speed, and altitude profiles for takeoff and landing operations. The NIRS database contains standard noise and performance data for over one hundred different fixed wing aircraft types, most of which are civilian aircraft. NIRS automatically accesses the noise and performance data for takeoff and landing operations by those aircraft.

This study included many different aircraft types. While many aircraft could be modeled by direct assignments from the standard NIRS database, several were not listed as procedure steps in the NIRS database. For those aircraft types not in the NIRS standard database, FAA-approved substitutions were used to model the aircraft with a similar type that was in the database, listed in NIRS User's Guide Version 7.0b.2 Appendix E.

The day-night split of aircraft operations is important with the DNL metric. Nighttime operations, defined as an operation between 10 PM and 7 AM, are weighted 10 dB (i.e., as if the event occurred ten times).

For analysis of those parts of the study area beyond the immediate environs of MDW, this EA involved a detailed analysis of IFR aircraft for existing conditions (2012) using NIRS. Although the noise environment around MDW comes almost entirely from jet aircraft operations, the DNL calculations reflect noise from many types of jet and propeller aircraft operations on IFR flight plans, which the Proposed Action could affect. Most aircraft around MDW operate IFR to obtain ATC separation services in these busy areas. Aircraft operating under VFR are not included in the NIRS analysis as they would be unaffected by the Proposed Action. VFR aircraft operating outside certain categories of controlled airspace are not required to be in contact with ATC. Since these aircraft operate at the discretion of the pilot on the "see and be seen" principle and are not required to file flight plans, the FAA has very limited information for these operations. There is no known source for comprehensive route, altitude, aircraft type, and frequency information for VFR operations for the entire study area. Even if complete information were available for VFR operations, the Proposed Action evaluated in the EA would not require a change to the route or altitude of these operations. Therefore, if modeling were possible, both the Proposed Action and No Action Alternative would show the same flight route and altitude.

Table E.3-4 provides daily operations for the existing conditions (2012). Tables E.3-5 and E.3-6 present the operations for the 2013 and 2018 No Action Alternative and Proposed Action, respectively.

E.3.5 Runway Utilization

Runway use describes the percent of each of the runways used over an annual period, which is affected by many factors including weather, runway length requirements, instrumentation available on each runway, and, if applicable, traffic flow at nearby airports. HMMH identified runway use information presented in CDA, “2013 Part 150 Noise Study Update.” Table E.3-7 provides runway use data for the existing conditions (2012) and the No Action Alternative in 2013 and 2018. Table E.3-8 provides data for the Proposed Action in 2013 and 2018.

Table E.3-7 Runway Utilization – Existing Conditions (2013) and No Action (2013 and 2018)

	Runway	Base Year 2012	First Year 2013	Future Year 2018
Arrivals	04L	3.1%	3.0%	2.5%
	04R	39.0%	37.1%	31.6%
	13C	2.9%	4.9%	12.7%
	13L	<0.1%	0.1%	0.2%

E.3.6 Flight Tracks

Flight tracks represent the route and altitude profile of an aircraft's flight path. Track use information for the MDW was derived from the CDA "2013 Part 150 Noise Study Update." The flight tracks used for INM in the Part 150 were extended to the boundaries of the MDW EA study area for use in NIRS by following the current STAR points for the No Action scenarios and the new STAR points for the Proposed Action scenarios. Using the 85 day, 24 hour radar sample, each track was scaled to the percent use of each procedure branch. Please refer to Figures 7, 8, and 9 in Section 3.3.2 for the flight tracks developed for comparisons of the air traffic procedure changes under the Proposed Action and the No Action Alternative. Tables E.3-9 and E.3.10 (attached) provide full detail regarding the track associations between INM and NIRS.

E.3.7 Meteorological Conditions

NIRS has several settings that affect aircraft performance profiles and sound propagation based on meteorological data. Meteorological settings include average annual temperature, barometric pressure, and relative humidity at the airport. Weather data for the MDW EA was acquired from CDA, "2013 Part 150 Noise Study Update." Average annual conditions for MDW include a temperature of 51.8°F, sea level pressure of 29.99 inch of mercury (inHg), and relative humidity of 67.9 percent.

E.3.8 Modeling Locations

While the previous sections have discussed parameters that affect the noise source considered in this study (i.e. aircraft operations), NIRS also requires input regarding various modeling locations, or noise receivers, for which aircraft noise exposure levels were computed. These locations primarily represent noise sensitive land use areas or other locations of interest. Several different types of locations were identified in the MDW EA study area, represented by 143,345 unique model points (available upon request). All model points were adjusted for elevation, as derived from United States Geographic Survey (USGS) terrain data. Terrain files imported into NIRS for noise computations must be in the USGS 1:250,000 scale DEM format (i.e., 1⁰ square with 3 by 3 arc-second data spacing).

Office of Environment and Energy

800 Independence Ave., S.W.
Washington, D.C. 20591

Date: April 13, 2012

Nan L. Terry
Environmental Specialist
FAA ATO Central Service Center
Operations Support Group, South Team, AIV-C2

Dear Nan,

The Office of Environment and Energy (AEE) has received the memo dated March 2, 2012, referencing HMMH Project number 304050.002 requesting configuration parameters in the Noise Integrated Routing System (NIRS) that will allow implementation of custom profiles below 3000 ft. The request is related to the development of the noise section of the Chicago Midway (MDW) Proposed RNAV/RNP Procedures Environmental Assessment (EA) using NIRS version 7.0b2.

Current FAA policy for applying NIRS requires the use of standard profiles below 3,000 ft. Above Field Elevation (AFE); however, after reviewing flight profiles for Midway Airport, HMMH determined that there are many procedures occurring below this flight level that do not conform to the standard profile below 3,000 ft. AFE. In addition, elements of the proposed action will also include procedures with altitudes below 3000 ft. AFE.

AEE has reviewed the request and approves the use of custom profiles below 3000 ft. AFE in order to perform a sensitivity to determine whether custom profiles are warranted. To implement custom profiles below 3000 ft., the NIRS control code – 4 should be used.

Please understand that this approval is limited to this particular EA for MDW. Any additional projects or non-standard modeling at MDW or any other site will require separate approval.

Sincerely,

Rebecca Cointin, Acting Manager
AEE/Noise Division

Nan L. Terry
Environmental Specialist
FAA ATO Central Service Center
Operations Support Group, South Team, AJV-C2

Dear Nan,

The Office of Environment and Energy (AEE) has reviewed the proposed non-standard Noise Integrated Routing System (NIRS) aircraft substitutions for the Chicago Midway (MDW) Environmental Assessment (EA).

Harris Miller Miller & Hanson Inc. (HMMH) is assisting FAA in conducting the Environmental Assessment (EA) and is trying to model certain aircraft types that are not included in the NIRS database. HMMH has proposed substitutions for five aircraft types that currently do not have a direct NIRS equivalent in the aircraft database. The proposed substitutions and the corresponding AEE recommendations are summarized in the table below.

Aircraft	HMMH Proposed Substitution	AEE Recommendation*
SABR80	LEAR25	FAL20
D328J	CL600	Concur
MD83	MD9025	Concur
MD81	MD9025	Concur
737-800	737700	Concur

*These substitutions apply only to Arrival operations with the exception of the SABR80 and D328J substitutions for which it applies to both Arrival and Departure Operations.

AEE concurs with all but one of the proposed substitutions. The aircraft type FAL20 should be used as a substitute for the SABR80. The FAL20 has noise levels closer to the SABR80 than the LEAR25.

Please understand that this approval is limited to this particular EA for MDW. Any additional projects or non-standard input at MDW or any other site will require separate approval.

Sincerely,

Rebecca Cointin, Acting Manager
AEE/Noise Division

Notes:

1. Some Section 4(f) resources do not fall entirely within the DNL 64 dB noise exposure contour or adjoin the contour. For the purpose of this evaluation, these resources were evaluated using the INM model even though the grid point (centroid) for the resource may have been located outside of the contour.
2. Points identified for Historic Site 1 and Site 2 represent the same property.

Appendix H COORDINATION AND CONSULTATION

H.1 PUBLIC INVOLVEMENT

This chapter describes the FAA's public involvement process, which the FAA has undertaken in accordance with CEQ regulations and FAA Order 1050.1E. The subsequent sections present information on the review and comment process for this EA involving Native American Tribes, Federal, state and local government agencies, elected officials, and the public (including non-governmental organizations, trade associations, and other stakeholder representatives). Appendix H, *Coordination and Consultation*, presents documentation of notices sent, public meetings scheduled and held, and comments received.

The FAA Air Traffic Organization (ATO) – Central Service Center, the FAA Airports Division – Great Lakes Region, and the City of Chicago – Department of Aviation (CDA) have jointly coordinated the public involvement process undertaken in conjunction with this EA.

H.1.1 Draft EA Publication and Public Comment Period

For publication of the Draft EA and the concurrently released Draft Part 150 Update, "Notices of Public Comment Period" were posted in the *Chicago Sun-Times* on February 17 and 19, 2013. See Appendix H.3 for copies of these public notices.

The Draft EA was then made available for public review on the CDA web site and in paper format at the FAA Chicago Airports District Office and several local libraries.

Written comments on the Draft EA were also solicited by mail and email. All comments were carefully reviewed if postmarked or received by April 5, 2013, and substantive comments were addressed in the Final EA. In addition, the following public agencies and municipalities received the Draft EA for review and comment:

- US Department of Transportation - FAA, Great Lakes Region - Chicago Airports District Office
- US Environmental Protection Agency
- US Department of the Interior – Fish and Wildlife Service
- Illinois Department of Transportation – Division of Aeronautics
- Illinois Environmental Protection Agency
- Chicago Metropolitan Agency for Planning (CMAP)
- Northwestern Indiana Regional Planning Commission (NIRPC)
- Chicago Midway International Airport
- Midway Noise Compatibility Commission
- Cook County
- Village of Bedford Park
- Village of Bridgeview
- City of Burbank
- Town of Cicero
- Village of Forest View
- Village of Lyons
- Village of Stickney
- Village of Summit

Appendix H.4 includes all public and agency comments received during the public comment period, as well as their respective FAA responses. As appropriate, edits to the Final EA were made to address issues raised during the public comment period.

H.1.2 Draft EA Public Hearing

After publication of the Draft EA and the Draft Part 150 Update, “Notices of Public Hearing” were posted in the *Chicago Sun-Times* on February 17 and 19, 2013, published in conjunction with the “Notices of Public Comment Period.” See Appendix H.3 for copies of these public notices.

The FAA and CDA co-facilitated the Public Hearing regarding the Draft EA and Draft Part 150 update on March 21, 2013 at The Mayfield (6072 South Archer Avenue, Chicago, IL 60638). Both verbal and written comments were accepted by a court reporter. Appendix H.4 includes all comments received during the public hearing, as well as their respective FAA responses. As appropriate, edits to the Final EA were made to address issues raised during the public hearing.

H.1.3 Final EA Publication

The Final EA is available for review as of May 25, 2013, for a period of at least at least 30 days, posted on the CDA “Midway Residential Sound Insulation Program” web page (<http://www.flychicago.com/midway/en/AboutUs/NoiseManagement/RSIP/Pages/Residential-SIP.aspx>) and in paper format at the following locations:

Federal Aviation Administration

Chicago Airports District Office
2300 E. Devon Ave., Rm. 320
Des Plaines, Illinois 60018

Chicago Department of Aviation

Chicago O'Hare International Airport
10510 W. Zemke Rd.
Chicago, IL 60666

Chicago Midway International Airport
6201 S. Laramie Ave.
Chicago, IL 60638

For appointments to review, call (773) 686-3563.

For appointments to review, call (773) 838-0757.

Local Libraries

Archer Heights Public Library

H.2 LETTERS TO GOVERNMENT AGENCIES, AND ELECTED OFFICIALS

H.2.1 Sample Notice of Availability

U.S. Department
of Transportation
**Federal Aviation
Administration**

Air Traffic Organization
Central Service Center

2601 Meacham Blvd.
Fort Worth, TX 76137

February 18, 2013

Notice of Availability: Chicago Midway Proposed Air Traffic Procedural Changes Draft Environmental Assessment (EA)

This letter is to inform you that the Federal Aviation Administration (FAA) has prepared an Environmental Assessment (EA) to consider the potential environmental impacts arising from implementation of the proposed air traffic procedural changes at Chicago Midway International Airport, Chicago, Illinois.

The FAA proposes changes in aircraft flight paths and altitudes at Chicago Midway International Airport (MDW). Specifically, the FAA proposes to publish and implement standard arrival and instrument approach procedures, serving MDW and changes in departures. The proposed action would not cause any ground disturbance nor increase the number of aircraft operations at MDW. The analysis of potential environmental impacts in the EA was conducted in accordance with FAA Order 1050.1E, *Environmental Impacts: Policies and Procedures*.

As of the date of this letter, the Draft EA is released and made publicly available for review and comment. The documents are available online at:

<http://www.flychicago.com/midway/en/AboutUs/Community/default.aspx>

If you desire to provide comments, please provide them by letter or email, before April 5, 2013 to the undersigned at the following address:

Ms. Nan Terry – AJV-C2
Federal Aviation Administration
ATO CSC OSG
2601 Meacham Boulevard
Fort Worth, Texas 76137
Via email: Nan.L.Terry@faa.gov

The public is also invited to attend a joint Public Hearing regarding the Midway Draft EA. Staff with the FAA and consultants will be available to answer questions and on the Draft EA at a public hearing detailed below. The public hearing will be held in an open house workshop style, and both verbal and written comments will be accepted by a court reporter. No formal presentation will be made. General materials provided at the hearing will be available in English only.

February 18, 2013

2

Public hearing details:

Draft EA Public Hearing
Open House Format
Thursday, March 21, 2013
5:00 p.m. to 9:00 p.m.
The Mayfield, 6072 S. Archer Avenue, Chicago, Illinois 60638

FAA would like to thank you for your interest in this project. If you have any questions about the information provided, please feel free to contact me.

Sincerely,

Nan Terry
Environmental Specialist

Enclosure: Chicago Air Traffic Procedural Changes, Draft EA – on CD

H.3 PUBLIC NOTICES

Draft EA Public Notice Text, as posted in Chicago Sun-Times, Feb. 17 and 19, 2013

PUBLIC NOTICE

NOTICE OF PUBLIC COMMENT PERIOD AND NOTICE OF PUBLIC HEARING

The Chicago Department of Aviation (CDA), the owner and operator of Midway International Airport (MDW), is conducting an update to a FAR Part 150 Airport Noise Compatibility Study (Draft Part 150 Update). The CDA submitted the original Part 150 Study in 1992, and the Federal Aviation Administration (FAA) approved the study in 1993. The CDA has three primary purposes for the Update: 1) updating the 65 DNL noise contour for Midway; 2) updating the status of the original sixteen noise compatibility measures from the 1992 Study; and 3) adding noise compatibility measures in order to make those measures eligible for FAA grant funding.

Concurrently, as part of its effort to achieve Next Generation Air Transportation System (NextGen) goals, the FAA proposes to implement new Area Navigation (RNAV) flight routes and procedures, inclusive of Required Navigation Performance (RNP), at MDW. These changes will enable the FAA to manage air traffic more efficiently, while maintaining or improving safety associated with aircraft flying into and out of MDW. FAA has prepared a Draft Environmental Assessment (EA) to identify the potential environmental impacts associated with these changes. In accordance with the National Environmental Policy Act of 1969 (NEPA) as amended, and the Airport and Airway Improvement Act of 1982 as amended, the FAA must consider the environmental impact of Federal actions such as the modification of RNAV/RNP procedures and the changes to departure headings as proposed at MDW.

The public is invited to provide public comment on the Draft Part 150 Update and the Draft EA for a 45-day period beginning on Tuesday, February 19, 2013, and ending on Friday, April 5, 2013. Written comments on the Draft Part 150 Update should be addressed to Mr. Aaron Frame, Assistant Commissioner, Chicago O'Hare International Airport, 10510 W. Zemke Road, Chicago, Illinois 60666. Any written comments may also e-mailed to the CDA at midwaypart150@cityofchicago.org. Written comments on the Draft EA should be addressed to Ms. Nan Terry, Federal Aviation Administration, 2601 Meacham Boulevard, ATO CSC OSG, ATTN: AJV-C2, Fort Worth, Texas 76137. Any written comments on the Draft EA may also be e-mailed to the FAA at Nan.L.Terry@faa.gov.

Copies of the Draft Part 150 Update are available for public review at the locations below. For an electronic version on the Internet, go to www.flychicago.com/mdwp150. For a paper version, please visit these offices:

The public is also invited to attend a joint Public Hearing regarding the Draft Part 150 Update and the Draft EA. The CDA staff and consultants preparing the Draft Part 150 Update will be available to answer questions on the Update, and FAA staff and consultants will be available to answer questions on the Draft EA at a public hearing detailed below. The public hearing will be held in an open house style, and both verbal and written comments will be accepted by a court reporter. No formal presentation will be made. General materials provided at the hearing will be available in English only. If special assistance or translation services are necessary for the public hearing, please contact Assistant Commissioner Aaron Frame before 4:00 p.m. on Thursday, March 14, 2013. Written comments will be accepted for a two-week period after the public hearing until Friday, April 5, 2013.

Air Traffic Procedural Changes, Environmental Assessment
Final

H-11

May 24, 2013

Final EA Public Notice text, as posted in Chicago Sun-Times, May 25, 2013

PUBLIC NOTICE

**NOTICE OF AVAILABILITY OF FINAL ENVIRONMENTAL ASSESSMENT
AND NOTICE OF PUBLIC COMMENT PERIOD FOR THE DRAFT FINDING OF NO SIGNIFICANT IMPACT**

As part of its effort to achieve Next Generation Air Transportation System (NextGen) goals, the FAA proposes to implement new Area Navigation (RNAV) flight routes and procedures, inclusive of Required Navigation Performance (RNP), at Chicago Midway International Airport (MDW). These changes will enable the FAA to manage air traffic more efficiently, while maintaining or improving safety associated with aircraft flying into and out of MDW. In accordance with the National Environmental Policy Act of 1969 (NEPA) as amended, the FAA has prepared a Final Environmental Assessment (EA) to identify the potential environmental impacts associated with these changes. In addition, FAA has prepared a Draft Finding of No Significant Impacts (FONSI).

The public is invited to provide comments on the Draft FONSI for a 30-day period beginning on Saturday, May 25, 2013, and ending on Monday, June 24, 2013. Written comments on the Draft FONSI should be addressed to: Ms. Nan Terry, Federal Aviation Administration, 2601 Meacham Boulevard, ATO CSC OSG, ATTN: AJV-C2, Fort Worth, Texas 76137 and may also be e-mailed to the FAA at: Nan.L.Terry@faa.gov.

Copies of the Final EA and Draft FONSI are available for public review at the locations listed below. For an electronic version on the Internet, go to <http://www.flychicago.com/midway/en/AboutUs/NoiseManagement/RSIP/Pages/Residential-SIP.aspx>.

H.4 COMMENTS AND RESPONSES

Comments Received for MDW Draft EA
and FAA Responses

Agency/Organization	Name	Letter Date	Comment Number	Comment	FAA Response
Illinois Environmental Protection Agency	Lisa Bonnett	2/21/2013	EPA1	The Agency has reviewed this submission and has no comments or objections to the proposed project at this time	Comment noted
Environmental Protection Agency	Kenneth Westlake	4/3/2013	EPA1	The Draft EA states (p. 110), "Implementation of the Proposed Action would result in DNL [Day-Night Average Sound Level] increases of 1.5 dB [decibels] or more in noise sensitive areas exposed to aircraft noise at or above DNL 65 dB. However, these impacts would be mitigated through the City of Chicago Department of Aviation's ongoing sound insulation program as part of their Part 150 Study." These increases would occur northeast of Midway Airport. Recommendation: In the Final EA, EPA requests that an additional section on sound mitigation be provided; specifically, what specific mitigation measures are proposed for these areas? In what time frame will mitigation measures be implemented, and how will implementation be scheduled between 2013 and 2018? While the Draft EA states that these areas of impacted land use would be evaluated, and mitigation measures proposed, under the framework of the Part 150 Noise Study, EPA requests that the Final EA provide additional information on what a Part 150 Noise Study is and how it relates to noise contour increases associated with the Proposed Action. Information should be provided in plain language. Additionally, EPA requests that FAA discern between single-family and multi-family residences, and distinguish if mitigation measures will be provided for both single-family and multi-family homes.	See revised text in Chapter 4 and 5 Compatible Land Use sections for discussion of mitigation measures for this resource category and a description of the Part 150 program, generally.

and FAA Responses

Agency/Organization	Name	Letter Date	Comment Number	Comment	FAA Response
Environmental Protection Agency	Kenneth Westlake	4/3/2013	EPA2	The Draft EA (page 165) states, "the Proposed Action would result in reportable and significant noise impacts associated with minority and low-income populations." However, the Draft EA is silent with regard to discussion of mitigation of impacts to potential environmental justice communities. Recommendation: EPA recommends that the Final EA include a narrative discussion of mitigation measures to ensure that impacts to environmental justice communities are not disproportionate	See revised text in Chapter 4 and 5 Compatible Land Use sections for discussion of mitigation measures for this resource category and a description of the Part 150 program, generally. The RSIP is a voluntary program and eligibility for participation is a function of whether an existing incompatible dwelling is or would be exposed to incompatible levels of aircraft noise, subject to available funding and the Congressional authorization and appropriations process. Eligibility for participation is determined without regard to race, color, creed, national origin, gender, or household income levels. The FAA has determined that ongoing implementation and continuance of the MDW Part 150 programs in general, and the RSIP in particular would reduce the impact from aircraft noise (and its corresponding effect on compatible land use) to less than significant levels. Under the provisions of EO 12898 <i>Federal Actions to Address Environmental Justice in Minority Populations and Low Income Populations</i> and CEQ guidance, in the absence of a significant impact a disproportionate impact to minority or low-income populations would not occur. However, as encouraged by the EO and CEQ guidance, the FAA discloses in section 5.10.3.1 where significant impacts would occur (prior to mitigation) and their setting and context with respect to minority or low-income populations at the census block and block group levels, respectively. See revised text in FEA.
Environmental Protection Agency	Kenneth Westlake	4/3/2013	EPA3	The Draft EA (page 172) indicates that census blocks that have significant noise increases have minority populations that range from 70.7 percent to 85.6 percent of the total population, and that the Hispanic/Latino minority group comprises the largest percentage of the minority population therein. However, the Draft EA is silent on how FAA is ensuring that affected minority populations are aware of the proposed project, and on whether or not FAA has undertaken public outreach or public meetings with these communities. Recommendation: EPA recommends that the Final EA include additional information on measures FAA has taken/will take to ensure that environmental justice communities are aware of the proposal and have the opportunity and understanding on how to comment on the proposed project. EPA recommends that outreach strategies consider the range of appropriate languages or dialects of the impacted communities so that meaningful public participation can be achieved.	Appendix H of the FEA describes the process employed for coordination and consultation with agencies of special expertise and the public. FAA mailed copies of the Draft EA to the US Fish and Wildlife Service, the State Historic Preservation Officer for the State of Illinois, and the Illinois Department of Natural Resources on February 18, 2013. FAA has not received any comments from these agencies. FAA will mail these same agencies copies of the FEA and the Draft FONSI/ROD.

and FAA Responses

Agency/Organization	Name	Letter Date	Comment Number	Comment	FAA Response
Environmental Protection Agency	Kenneth Westlake	4/3/2013	EPA4	The Draft EA (page 154) states the Proposed Action, "Is not anticipated to have an adverse impact" on historic resources. The Draft EA (page 161) also states, "no increased risk of impacts to Federally- or state-listed species or migratory birds are [sic] expected to occur. Therefore, there are no anticipated impacts to airborne wildlife, including migratory birds and Federally- or state-listed species." Recommendation: To document coordination efforts among agencies, including, but not limited to, the U.S. Fish and Wildlife Service (USFWS), the Illinois Department of Natural Resources (IDNR), and the State Historic Preservation Office (SHPO), EPA recommends that you provide all correspondence sent to, and received from, other agencies as an appendix to the Final EA.	Appendix H of the FEA describes the process employed for coordination and consultation with agencies of special expertise and the public.
Self	Unknown	3/21/2013	UNK1	I am a homeowner in the 4000 block of South Kostner. I'm just one block north of the 65 DNL line. I do have planes that fly over my house at times. I am affected by the noise.	The FAA acknowledges that the commenter is exposed to noise from aircraft operations and that aircraft may fly in the vicinity of his/her dwelling. However, as acknowledged in the comment, his/her dwelling does not lie within the DNL 65 dB noise contour.
Self	Unknown	3/21/2013	UNK2	The noise from the planes between the brick buildings seems like it echoes more, enhancing the noise from the planes. The noise does affect my sleep, my way of life, watching TV and conversations.	The FAA acknowledges that the commenter is exposed to noise from aircraft operations; however, his/her dwelling does not lie within the DNL 65 dB noise contour. Noise modeling and impact analysis were conducted in accordance with FAAO Order 1050.1E. Appendix E.1 of the EA describes in general terms the potential effects from exposure to aircraft noise at varying levels, including potential for sleep disturbance or speech interference. The predicted noise exposure from the aircraft operations at specific locations in the vicinity of Chicago Midway International Airport is presented in Chapter 5.

and FAA Responses

Agency/Organization	Name	Letter Date	Comment Number	Comment	FAA Response
Self	Unknown	3/21/2013	UNK3	Myself and neighbors I spoke with that couldn't come today agree that we'd like to be included in the sound insulation program because of the noise that we receive from the planes.	The FAA acknowledges that the commenter, like many residents in the vicinity of Chicago Midway International Airport, is exposed to noise from aircraft operations. However, his/her dwelling would not lie within the DNL 65 dB noise contour associated with aircraft operations at Chicago Midway International Airport that would occur under the Proposed Action (2018). The predicted noise exposure from this level of activity is depicted in the EA in Chapter 5 on Figure 18 in the EA. This same level of activity appears as "Noise Exposure Map - 2" in the Chicago Midway International Airport Part 150 Study Update. Implementation of the Proposed Action would not have a significant noise impact on a sensitive noise receiver (i.e., residence) in the commenter's block as the predicted noise exposure from aircraft operations would not exceed DNL 65 dB. The FAA Part 150 Program, of which sound insulation is an element, applies to properties exposed to noise levels equaling or exceeding DNL 65 dB.
Self	Cassandra Rodriguez	3/21/2013	CR1	I don't understand how the contour doesn't cover my block. It cuts off the block before and starts another seven blocks later, but the planes, mostly on the return flight to Midway -- and I know they are going to change direction, but at this time we have been excluded from the new proposal for sound insulation. I believe it's the 150 plan.	The FAA acknowledges that the commenter, like many residents in the vicinity of Chicago Midway International Airport, is exposed to noise from aircraft operations. However, as the commenter notes, her dwelling would not lie within the DNL 65 dB noise contour associated with aircraft operations at Chicago Midway International Airport that would occur under the Proposed Action (2018). The predicted noise exposure from this level of activity is depicted in the EA in Chapter 5 on Figure 18 in the EA. This same level of activity appears as "Noise Exposure Map - 2" in the Chicago Midway International Airport Part 150 Study Update. Implementation of the Proposed Action would not have a significant noise impact on a sensitive noise receiver (i.e., residence) in the commenter's block as the predicted noise exposure from aircraft operations would not exceed DNL 65 dB and experience a 1.5 dB increase. The FAA Part 150 Program, of which sound insulation is an element, applies to properties exposed to noise levels equaling or exceeding DNL 65 dB.
Self	Michael Kroposki Esq.	4/1/2013	MK1	The EA should state specifically the algorithm used to calculate take off weights and specifically state the assumptions made in the calculations. While use of the default settings 65% payload may have been realistic in 1970, the current Load Factors clearly show it is not so today [The FAA recently reported the national average domestic Load Factor as 83.2%]. A more realistic average weight is most likely near 100% payload.	The EA, in Appendix E2, Section 2.4.6 , "Aircraft Weight and Trip Length" at page E29 provides a discussion of take off weights. A load factor of near 100% is not realistic when computing average annual day conditions. INM and NIRS have a standard passenger load factor built into the model. The average weight calculation includes more than passenger load factor. It also includes the weight of the aircraft, cargo, and fuel.

and FAA Responses

Agency/Organization	Name	Letter Date	Comment Number	Comment	FAA Response
Self	Michael Kroposki Esq.	4/1/2013	MK2	INM noise calculations are especially sensitive to variations in take off weight. One study of input sensitivities has shown that a 10% variation in take off weight leads to an error of 3-7 dB [2].	Noise calculations are sensitive to many noise modeling input variables. It is not technically sound to look at one variable, e.g. takeoff weight, in isolation. The commenter did not include references or a listing of literature cited with his comment letter. FAA notes that this comment was made by the commenter at other locations including footnote reference. If this is the intent of the commenter, the FAA references that footnote to be as follows: [2] "Sensitivity of FAA Integrated Noise Model to Input Parameters" , Applied Acoustics, Vol 66, Issue 3, March 2005, pages 263-276. If so, the commenter has misstated the data in the referenced study. The study reports in Table 8 that a 10 percent weight increase can result in a SEL (not DNL) variation of +0.70 decibels to +2.20 decibels.
Self	Michael Kroposki Esq.	4/1/2013	MK3	Since large jet aircraft are most likely the largest contributors of noise energy, an error in the largest contributors to DNL will predominate since noise as measured by DNL is aggregated logarithmically. Assuming unrealistically low take off weights have been used in the draft EA, it may be assumed that the calculated DNL's are significantly underestimated!	The commenter's assumption that calculated DNLs are significantly underestimated is not accurate and appears to be based on his assumption that the passenger load factor is the prevailing variable in the noise model. Noise calculations are sensitive to many noise modeling input variables. For example, the noise model uses a conservative value of 100% thrust for departure procedures, although airlines typically do not use 100% power in takeoff. Thrust reduction at takeoff varies. Therefore, the 100% thrust assumption will result in higher noise calculations than may occur for particular departures. The goal of the noise analysis is to capture the average annual conditions at the airport.

and FAA Responses

Agency/Organization	Name	Letter Date	Comment Number	Comment	FAA Response
Self	Michael Kroposki Esq.	4/1/2013	MK4	The consequence of this conclusion has direct impact on the overall environmental impact determination because even the underestimated DNLs were extremely close to the 65 dB level of regulatory significance. If they in fact exceed this level, a finding of significant impacts is warranted instead of the finding of no significant impact stated in the EA draft	See response to MK3 above. Noise calculations are sensitive to many noise modeling input variables. The goal of the noise analysis is to capture the average annual conditions at the airport. The FAA has determined that the DNL results do not exceed the FAA's threshold for a significant noise impact.
Self	Michael Kroposki Esq.	4/1/2013	MK5	The draft EA confuses DNL with YDNL. On page 65 of the draft EA there is a referenced [sic] to "annual DNL" which would appear to be the same as YDNL. Order 1050.1E paragraph 14.3, SIGNIFICANT IMPACT THRESHOLDS, speaks in terms of DNL which is a widely recognized term in most federal agencies. While Paragraph 14.1a mentions yearly DNL, paragraph 14.4b	The draft EA does not contain the quoted text "annual DNL" indicated by the commenter. Results presented are in terms of DNL.

Comments Received for MDW Draft EA
and FAA Responses

Agency/Organization	Name	Letter Date	Comment Number	Comment	FAA Response
Self	Michael Kroposki Esq.	4/1/2013	MK6	I was very surprised to see in the draft EA reference to calculated DNLs 58.1 and 66.6 [page 79]. These numbers are meaningless and therefore misleading because it is my understanding that the precision and accuracy of INM output is at best about +/- 1.0 dB . Also the NIRS output DNL and therefore population numbers calculated there most likely have no better precision and accuracy than INM [NIRS uses the INM calculation module] and it is most likely less due to errors introduced by truncation, round off and averaging.	As required by FAA Order 1050.1E, Appendix A, Section 14.5e, the FAA conducted noise modeling using INM (in vicinity of the airport) and NIRS (beyond the immediate vicinity of the airport where the action would include portions of the study area where aircraft would operate at or above 3,000 feet above ground level). See Section 4.3.1, specifically page 58 where this methodology is presented. The noise values presented in the EA are those reported by INM and NIRS. Reporting results to 0.1 dB is consistent with FAA Order 1050.1E, under which the criterion for significant noise impact is expressed to units of 0.1 dB (see FAA Order 1050.1E, Appendix A, Section 14.3).
Self	Michael Kroposki Esq.	4/1/2013	MK7	The final EA should state the uncertainty in the output by indicating the validated range of the output numbers, for example 63.45 +/- 0.05dB. This range is commonly referred to as the confidence interval at a stated level of significance, ie 95%.	FAA noise models do not provide confidence interval information.
Self	Michael Kroposki Esq.	4/1/2013	MK8	Since AEDT uses modeling calculations very similar to INM it is likely the levels of uncertainty found in the AEDT sensitivity analysis are likely to also be present in the NIRS output. The recently studied AEDT levels of uncertainty should be cited as a guide to uncertainty in the similar NIRS software.	The AEDT uncertainty quantification, still under preparation, is not an applicable guide for previous noise models. The AEDT uncertainty quantification will not provide confidence interval information for noise.
Self	Michael Kroposki Esq.	4/1/2013	MK9	The range of uncertainty in the reported DNLs should be stated along with a table of all actual DNL values calculated. In addition a noise contour map of the actual calculated DNLs are important for the public understanding of the project's noise impacts. Noise is the central problem being addressed in this EA and needs to be clearly and completely stated for the public's understanding of the environmental impact of the proposed action.	Please see response to previous comment [MK6]

Comments Received for MDW Draft EA
and FAA Responses

Agency/Organization	Name	Letter Date	Comment Number	Comment	FAA Response
Self	Michael Kroposki Esq.	4/1/2013	MK10	The FAA NEPA regulations use whole numbers, for example 65 dB, with one exception 1.5 dB (Order 1050.1E section 14), however table 22 in the draft EA on page 110 cites the noise limits as 3.0 and 5.0 dB. These are different numbers. A change of 4.6 dB would satisfy the 5 dB limit under standard numerical nomenclature but would not be valid according to table 23. Table 23 should be revised in accordance with Order 1050.1E	It is not necessary to revise Table 23 because this table presents modeled annual aircraft operations. With respect to Table 22, the presentation of the significant impact threshold and the reportable increase criteria in Table 22 is consistent with FAA Order 1050.1E, Appendix A, Section 14. The fact that some numbers in the Order are presented as whole numbers is a matter of formatting and stylistic convention. The Order does not use decimals with "zero" values, e.g. 63.0. See for example Appendix A, section 14.3: "For example, an increase from 63.5 to 65 dB is considered a significant impact." Thus, a change of 4.6 dB would not be rounded to 5 dB for comparison to the criteria in section 14.5e. The EA presents the noise values as reported by INMN and NIRS, which round to the nearest 1/10th of a dB. For comparison to noise criteria, FAA applied the criteria to the nearest 1/10th of a dB (consistent with the above reference Appendix A, section 14.3). FAA consistently applied this methodology throughout the analysis.
Self	Michael Kroposki Esq.	4/1/2013	MK11	RNAV air procedures when compared to conventional air procedures show a noise focusing directly along the center line of the flight path of the air procedure . While this focusing results in less noise impact for many people away from the center line, those under the flight path have a significant noise impact. Contour maps which are of sufficient detail to show this phenomena are need so that the public is fully informed of the noise impact of the RNAV air procedures included in this draft EA. Paragraph 14.4d of Order 1050.1E requires a noise contour map which is "Large enough and clear enough to be readily understood" (14-4e). The draft should be amended to include such a noise contour map. The population centroid maps are not detailed enough or clear enough to be readily understood	It is not necessary to revise the presentation of noise effects in the EA as it conforms to FAA Order 1050.1E. Noise contours from INM are presented for those areas in the immediate of Chicago Midway International Airport. See Figure 11 (page 61), Figure 18 (page 115), or Figure 19 (page 118) for noise contour depictions. For those areas not in the immediate vicinity of Chicago Midway International Airport, noise contours are not prepared, which is in accordance with FAA Order 1050.1E, Appendix A, Paragraph 14.5e.

Comments Received for MDW Draft EA
and FAA Responses

Agency/Organization	Name	Letter Date	Comment Number	Comment	FAA Response
Self	Michael Kroposki Esq.	4/1/2013	MK12	In the EA draft on page 64 it is stated that "the FAA estimated the exposure to various noise levels of all census block centroids in the study area, categorized in ranges of DNL (e.g., less than 45 dB, 45-50 dB, etc.). The FAA then estimated the population exposed to those noise levels as the number of people residing in each census block. As noise levels may vary throughout a census block, the actual number of people affected at a given noise level may be more or less than the total population of that census block." The method of making the above stated estimates needs to be explained. This statement should be clarified by also stating if the DNL for the block is a maximum number for any resident of the block and not an average. That is, could the actual number of people significantly impacted also be more? The accuracy and precision or the range of uncertainty in the number of people impacted should be stated.	Footnote 50 (page 64) of the EA defines what a census block centriod is, defining it as a single point in the geographic center of a census block. Noise exposure was calculated for the census block centroids (points) that fall within the study area. The EA states this on page 64: "However, as noted in the EA text cited by the commenter, the actual number of persons affected at a given noise level (i.e. the noise level calculated for the centriod) may be more or less than the total population of the census block. In fact, the distribution of population may or may not be uniform throughout a census block. However, the census block is the smallest unit of measure in census geography and represents the best available data despite its limitations. It would not be accurate to state that noise exposure level at a particular census block centroid is the maximum number for any resident of the census block. Nor, however, is it an average of noise exposure for the census block. Rather it is the noise exposure at the geographic center of the census block. No changes to the EA were made in response to this comment.
