

### **Lost Communications Procedures**

A Security zone will be placed for each flight that limits the operation of the sUAS. This security zone limits the operations using the on-board computer without the need of a link to the ground control station. In the event the sUAS violates the security zone the sUAS will initiate an autonomous landing.

Prior to flying PIC will have radio frequencies and phone numbers for any applicable ACT facilities available. If there is an ATC facility in the area of the flight the PIC will contact that facility prior to launch and maintain radio contact with the facility until flying is complete.

In the event of communications loss, PIC will contact the applicable ATC facility by cell phone. If flying in an area that communications are required and communications are lost, flight will be terminated. When communications is reestablished, if there is no other problem, PIC and ATC will decide if flying can continue.
