

## ***Launch and Recovery***

The Uglo 7 is hand launched. Recovery is via belly landing following a straight-in power-off approach. Note that take-off and landing will be done under human control with hand-over occurring when the aircraft is in a safe trim condition.

Prior to initiating set up procedures the PIC will check for applicable NOTAMs. During set up a handheld VHF radio tuned to the XLL Unicom frequency (122.7 MHz) will be monitored for incoming traffic.

If incoming traffic is detected via the VHF radio the PIC will initiate procedures to return to the landing site.
