

Adaptive Flight Hornet Maxi Visual Observers

Visual observers will be in several locations in support of Hornet Flight operations under this COA. One will be located on top of a building on the old USAF radar sight which is the highest point for miles around. This observer will be able to see any participating or non-participating aircraft at a minimum of three miles.

A second observer will be within verbal range of the PIC and pass any radio traffic from the other observer or aircraft traffic as necessary.

All observers will have the required FAA class II medical certificate and have completed the NMSU observer course. UAS flight range will be not greater than 1 nm horizontally from the ground control station and less if needed to maintain PIC awareness of the UAS.
