Aeryon Scout Lost Link Procedures

When the Aeryon Scout hovers for up to 3 minutes (can be PIC) changed to a shorter period, then climb to a maximum of 350' AGL if communications have not be restored. Then it proceeds directly to the LLP.

Other options are to land at location, or continue hover until system gets to low battery and then it lands. For our operations, NMSU PIC's will primarily use the return to LLP unless in an open area where safety of flight would dictate immediate landing.
