### **Re: Consistency Determination for Commercial Drone Delivery Operations in Florida**

The Federal Aviation Administration (FAA) is currently evaluating a proposal from Amazon.com Services, doing business as Prime Air, to introduce drone package delivery operations at six locations in the state of Florida (the Proposed Action). The FAA has determined that the proposed action, which would encompass all FAA approvals necessary to enable operations, is an unlisted activity under Florida's coastal management plan. Consistent with 15 CFR 930.54(a)(2) and FAA Order 1050.1G, the FAA is providing written notice of Prime Air's submission of an application for FAA authorization for an unlisted activity. The purpose of this letter is to coordinate with the State Coastal Management Program (CMP) and request the CMP's concurrence with the FAA's determination that the Proposed Action is consistent with the Florida CMP (FCMP).

The FAA is currently preparing a Draft Environmental Assessment (EA) to evaluate the potential environmental impacts that may result from the FAA's approval of the Proposed Action. The FAA is preparing this Draft EA pursuant to the National Environmental Policy Act of 1969 (NEPA) and its implementing regulations. The FAA has established a process to ensure compliance with the provisions of NEPA through FAA Order 1050.1G, *FAA National Environmental Policy Act Implementing Procedures*.

As required by statute and FAA Order 1050.1G, the FAA is currently consulting with the following parties:

- U.S. Fish & Wildlife Service (USFWS), in accordance with Section 7 of the Endangered Species Act, to consider the Proposed Action's potential to jeopardize any proposed, threatened, or endangered species or proposed or designated critical habitat.
- Florida State Historic Preservation Office (SHPO), in accordance with Section 106 of the National Historic Preservation Act, to consider the Proposed Action's potential direct and indirect effects to resources that are listed or eligible to be listed on the National Register of Historic Places.
- Federally Recognized Tribes in Florida, in accordance with Federal Executive Order 13175, *Consultation and Coordination with Indian Tribal Governments*; Presidential Memorandum, *Uniform Standards for Tribal Consultation*; DOT Order 5301.1A, *Department of Transportation Tribal Consultation Policy and Procedures*; and FAA Order 1210.20, *American Indian and Alaska Native Tribal Consultation Policy and Procedures*, to ensure they are provided the opportunity to provide meaningful and timely input regarding the Proposed Action.

The Proposed Action does not involve the issuance of a state or federal grant.

### **Proposed Action**

Prime Air is seeking FAA authorization to conduct commercial package deliveries using drones at six locations in the state of Florida (the proposed federal action). Prime Air intends to introduce its drone delivery capabilities in 2025 and has requested the FAA to authorize the operation of its MK30 drone, so it can provide drone package delivery services across each operating area. Prime Air projects flying up to 1,000 MK30 drone flights per operating day from each of the six Prime Air Drone Delivery Centers (PADDCs), with each flight taking a package to a customer delivery address before returning to the PADDC. The number of flights per day would vary based on customer demand and weather conditions. Prime Air is taking an incremental approach to operations and expects to gradually ramp up to 1,000 flights per day as consumer demand increases over time. Drone flights could be conducted up to 365 days a year between 7 A.M. and 10 P.M.

The six proposed drone operating areas are the delivery areas associated with each PADDC, as outlined in red in **Attachment A**. The locations of the proposed PADDC facilities are:

- TPA1 – 3350 Laurel Ridge Ave in Ruskin, FL
- TPA4 – 8727 Harney Rd in Tampa, FL
- SFL1 – 7469 Kingspointe Parkway, # 300, in Orlando, FL
- SFL3 – 6901 Hiatus Rd in Tamarac, FL
- SFL6 – 1301 President Barack Obama Highway in Riviera Beach, FL
- SFL9 – 3701 Flamingo Road in Miami, FL

Each proposed drone operating area would encompass approximately 175 square miles and a 7.5-mile drone operating radius around the PADDC.

Each proposed PADDC would be located at an existing logistics facility currently operated by Amazon Services. Landing pads used to support drone operations, which would include inspections, maintenance, charging/replacing drone batteries, and loading packages for customer delivery, would occupy a small portion of the facility's existing footprint (e.g., an existing parking lot). No significant physical alteration of existing infrastructure or ground disturbing activities would be required to enable the Proposed Action.

Prime Air does not expect to conduct package deliveries beyond coastal shorelines.

Approval of the Proposed Action will restrict Prime Air to operate only in these six locations; any future expansion beyond the authorization and limitations for the area of operations may require additional approval by the FAA, and may be subject to appropriate NEPA review, as necessary.

### Unmanned Aircraft

As pictured in **Attachment B**, the Prime Air MK30 drone is a hybrid multicopter fixed-wing tail-sitter drone with six propulsors allowing it to take-off and land vertically and transition to wing borne flight. Its airframe is composed of staggered tandem wings for stable wing-borne flight. The drone weighs approximately 78 pounds and has a maximum takeoff weight of approximately 83 pounds, which includes a maximum payload of 5 pounds. It has a maximum operating range of 7.5 miles and can fly up to about 67 miles per hour (mph) during wing-borne flight. It uses electric power from rechargeable lithium-ion batteries and is launched vertically using powered lift and converts to using wing lift during en route horizontal flight. The MK30 is equipped with collision avoidance technology to help avoid conflicts with other aircraft and drones during flight.

## Flight Operations

The MK30 drone would generally be operated at an altitude between 180 and 377 feet above ground level (AGL). The outbound en route altitude to a delivery location is expected to be flown between 180 and 279 feet AGL. The inbound en route altitude is expected to be flown between 279 and 377 feet back to the PADDC. At a delivery location, the drone would descend vertically to a stationary hover and drop a package to the ground. Once a package has been delivered, the drone would ascend vertically to the inbound transition altitude and depart the delivery area while climbing to the en route altitude to return to the PADDC. The PADDC is a controlled area wherein drone flights are launched and recovered. The drone would fly a predefined flight path that is set prior to takeoff. Flight missions would be automatically planned by Prime Air's flight planning software, which assigns, deconflicts, and routes each flight. In accordance with FAA safety requirements, the drone would avoid operating over areas with dense human populations, such as over roadways, public gathering spots, etc.

A typical drone flight profile can be broken into the following general flight phases: takeoff, en route outbound, delivery, en route inbound, and landing, as depicted in **Attachment C**.

### *Takeoff*

Once a package is loaded onto the MK30 drone and the drone is cleared for departure from the PADDC, the drone takes off from the ground vertically to an altitude of about 115 feet AGL and then transitions and climbs to its en route altitude of about 200 feet AGL (ranges from 180 and 279 feet AGL). The takeoff phase of flight would last less than one minute.

### *En Route Outbound*

The en route outbound phase is the part of flight in which the MK30 drone transits from the PADDC to a delivery point on a predefined flight path. During this flight phase, the drone will typically operate at an altitude of 200 feet AGL with a typical airspeed of 67 mph.

### *Delivery*

The delivery phase consists of descent from the en route altitude to a delivery point to deliver a package. The MK30 drone transitions and descends to about 140 feet AGL and then vertically descends to about 13 feet AGL while maintaining position over the delivery point. The drone hovers while dropping the package and then proceeds to climb vertically back to the inbound transition altitude of 197 feet AGL. The MK30 then transitions and climbs to its en route inbound altitude of 345 feet AGL (ranges from 279 to 377 feet AGL). The delivery phase of flight would last approximately one minute.

### *En Route Inbound*

The MK30 drone continues to fly at an altitude of about 345 feet AGL with a speed of 67 mph towards the PADDC.

### *Landing*

The drone decelerates as it approaches the PADDC and descends to the transition altitude of 197 feet AGL and where it transitions from horizontal flight to vertical flight, coming to a zero-speed position over its assigned landing pad. The MK30 drone slowly descends over its assigned landing pad and lands on the pad.

## Predicted Sound Levels

Based on a noise analysis using sound level measurement data for the MK30 drone, the estimated maximum sound exposure level (SEL) for the takeoff, delivery, and landing phases of flight are approximately 90.5 dB (at 20 feet), 92.1 dB (at 25 feet), and 91.8 dB (at 20 feet), respectively (see **Attachment D**). Predicted sound levels decrease as distances from the drone increase. The maximum SEL for the en route phase is approximately 63.7 dB when the drone is at an altitude of 200 feet AGL and flying at approximately 67 mph.

The drone is generally expected to fly the same outbound flight path between a PADDCC and the delivery point and inbound flight path back to the PADDCC. While the average daily deliveries from any PADDCC is not expected to exceed 1,000, the number of daily overflights will likely be dispersed because the PADDCC is centrally located in the delivery area, and delivery locations would be distributed throughout the proposed operating area. A conservative estimate for the maximum number of overflights over any one location is not expected to exceed half of the projected daily deliveries, or 500 deliveries. Since each delivery involves both an outbound and inbound flight path, this equates to 1,000 daily overflights. The resulting Day-Night Average Sound Level (DNL) could reach DNL 43 dB in any location within the APE.

Due to the inherent uncertainty of the exact delivery site locations, the noise analysis developed a minimum and maximum representative distribution of deliveries in each drone delivery area. The noise analysis conservatively assumes the minimum and maximum distribution of average daily deliveries that could occur at a single delivery location, which ranges from 1 to 4 deliveries per operating day. The noise for delivery operations also includes outbound and inbound en route overflights at the typical operating altitudes of 200 and 345 feet AGL, respectively, for operations associated with deliveries to other locations. The outbound en route altitude is expected to be flown between 180 and 279 feet AGL. The inbound en route altitude is expected to be flown between 279 and 377 feet AGL back to the PADDCC, with the resulting DNL of 52.5 at 16.4 feet.

### **Assessment of Potential Effects**

Based on the following, the FAA has determined that the Proposed Action would be consistent with the Florida Coastal Management Program Guide<sup>1</sup> and the 24 enforceable policies of the Florida Coastal Management Program:<sup>2</sup>

- Each proposed PADDCC location currently serves as an existing distribution/logistics facility for Amazon Service and the Proposed Action would not involve the construction of any new or alteration of any existing infrastructure.
- After departing the PADDCC, the drone would fly at about 67 mph to its delivery destination at between 180 and 279 feet. At the delivery location, the drone would descend to about 13 feet, stop, and drop the package to the customer. The drone would then ascend and fly back to the PADDCC at between 279 and 377 feet.
- During inbound and outbound flight, the drone would be visible for less than 4 seconds to an observer on the ground. The delivery process at the customer's location (descend, hover, ascend) would last less than one minute. The noise levels associated with outbound/inbound flight and delivery are not expected to exceed federal thresholds of significance.

---

<sup>1</sup> <https://floridadep.gov/sites/default/files/FCMP-Program-Guide-2024-09-30.pdf>.

<sup>2</sup> <https://floridadep.gov/rcp/fcmp/content/24-florida-statutes-florida-coastal-management-program>.

- Given the predicted noise levels and the short-term visual effects, drone operations are not expected to impact farmlands, parks, and recreational areas.
- The drones would be electrically powered and operate on batteries; therefore, the minimal emissions associated with battery charging would be unlikely to contribute to any exceedance of National Ambient Air Quality Standards.
- Because no ground disturbing activities, such as construction, would be involved and the drones would not touch the ground, except while at the PADDCC, the Proposed Action is not expected to impact any wetlands, floodplains, surface waterbodies, or groundwater resources.

As previously described, the FAA is still in the process of consulting with the USFWS Florida Ecological Field Services Office and the Florida SHPO to determine any potential impacts to biological and historical resources resulting from the Proposed Action. It is worth noting that the FAA has recently completed NEPA reviews for other similar Prime Air commercial drone delivery projects at College Station, TX and Tolleson, AZ.<sup>3</sup> As documented in Appendices C and D of both Final EAs, rigorous analytic and consultation processes, which included the integration of designated “no fly” areas to protect certain resources, determined that significant impacts to biological and historical resources were unlikely to result from operations similar to this Proposed Action.

#### **Conclusion**

The FAA requests your concurrence with the FAA’s determination that the Proposed Action is consistent with the FCMP. Your response within the next 30 days will greatly assist us in our environmental review process. In the event that you would like to consult with the FAA about the determination, please contact Christopher Hurst via email at [9-faa-drone-environmental@faa.gov](mailto:9-faa-drone-environmental@faa.gov).

Sincerely,

Joseph Hemler  
Manager, General Aviation and Commercial Branch (AFS-752)

# 1 Introduction

This document presents the methodology and estimation of noise exposure of Amazon Prime Air (Prime Air) package delivery operations under 14 CFR Part 135. Prime Air is proposing to conduct package delivery operations with the MK30 drone at selected distribution hubs (the Prime Air Drone Delivery Center, or PADDC).

The MK30 is an electric powered drone that uses a vertical take-off and landing (VTOL) then transitions to fixed-wing flight using wing lift during en route flight. The drone systems include hardware and software designed for safety and efficiency. The airframe is composed of staggered wings, the propulsion system includes a rechargeable lithium-ion battery, and six (6) motors that include propellers designed for noise reduction. The package delivery system contains the package in a two-door interior receptacle, and a camera and avionics system that has redundancy for critical systems. The drone weighs approximately 78 lbs. and has a maximum takeoff weight of 83.2 lbs., which includes a maximum payload of 5 lbs. It has a maximum operating range of 7.5 mi and can fly up to 400 ft above ground level (AGL) at a maximum cruise speed of 73 mph (64 knots) during horizontal flight. An image of the MK30 drone is shown in **Figure 1**.

The MK30 operational flight profiles can be broken into the following general flight phases: launch, en route outbound, delivery, en route inbound, and landing. After launch, the MK30 would ascend to an altitude of less than 400 ft AGL and follow a predefined route to its delivery site.<sup>1</sup> The MK30 would typically fly en route at between approximately 180 to 377 ft AGL, except when descending to drop a package. Packages would be carried internally in the drone's fuselage. When making a delivery, the drone descends, opens a set of payload doors, and drops the package to the ground from approximately 13 ft AGL. Prime Air's drone would not touch the ground in any place other than the PADDC (except during safe contingent landings) and will remain airborne throughout the operation including the delivery phase.<sup>2</sup> After the package is dropped, the MK30 drone climbs vertically and follows its predefined route back to the PADDC at its assigned altitude.

This document outlines the methodology and estimation of noise exposure expected with the proposed use of Prime Air's drone package delivery operations.<sup>3</sup> The methods presented below are suitable for the evaluation of Federal actions in compliance with the National Environmental Policy Act (NEPA) and other applicable environmental regulations or federal review standards at the discretion and approval of the FAA. In particular, this report is intended to function as a nonstandard equivalent methodology under FAA Order 1050.1F, and therefore requires prior written consent from the FAA's Office of Environment and Energy (AEE) for each project seeking a NEPA determination.<sup>4</sup> The results of the noise analysis are presented in terms of the annual Day-Night Average Sound Level (DNL), considering varying levels of operations for areas at ground level below each flight phase.

---

<sup>1</sup> Prime Air may modify operations, if warranted, to avoid or minimize any negative impacts.

<sup>2</sup> The MK30 vehicle is built with multiple redundant safety features and "detect and avoid" technology. The drone is designed to handle unexpected situations; it is independently safe.

<sup>3</sup> Environmental Assessment (EA) Noise Methodology Approval Request for Amazon Prime Air Commercial Package Delivery Operations with the MK30 Unmanned Aircraft (UA) from Detroit, Michigan, April 2025. (See Attachment A).

<sup>4</sup> See FAA Order 1050.1F, July 16, 2015,

Appendix B, Section B-1.2, for discussion on the use of "equivalent methodology", available online at [https://www.faa.gov/documentLibrary/media/Order/FAA\\_Order\\_1050\\_1F.pdf#page=113](https://www.faa.gov/documentLibrary/media/Order/FAA_Order_1050_1F.pdf#page=113)

## 2 Drone Delivery Operations

The PADDC and its associated flight routes are determined by Prime Air's business and operational needs. Takeoff pads at the PADDC are four meters by four meters. Landing pads are eight meters by eight meters. Both pads are contained within a launch area approximately 35 meters by 45 meters. A diagram of a representative PADDC layout is presented in **Figure 2**.

The MK30 drone is capable of vertical ascent and descent, hovering, and flying upright with forward-facing propellers for en route travel. Airspeeds during normal en route flight are expected to be approximately 58.3 knots. A typical flight will commence with a vertical ascent from the launch pad to the transition altitude of approximately 115 feet, from which it will continue a forward-facing climb to an outbound en route altitude between 180 and 279 feet AGL. The drone then maintains altitude and follows a predetermined route, traveling at 58.3 knots toward the designated delivery point. Prior to arrival at the delivery point, the drone will begin its descent down to a transition altitude of 140 feet and decelerate to zero-speed at which time it will arrive at the delivery point. The drone then begins a vertical descent to 13 feet AGL at which time the package is released. The drone will ascend back to a transition altitude of 197 feet, begin the outbound transition and climb phase to 345 feet, while accelerating to 58.3 knots until it reaches the inbound en route altitude between 279 and 377 feet along the predetermined route back to the PADDC. Prior to arriving at the PADDC, the drone will descend to the transition altitude of 197 feet, decelerate to zero speed, and begin a vertical descent to the landing pad.

Figure 2. Representative PADDC Layout

Source: Amazon Prime Air, 2022.

## 2.1 Flight Profiles

Flight profiles of drone operations are broken into five general phases: takeoff, transitions to and from vertical and horizontal flight, en route, delivery, and landing. These phases can be combined to represent the typical operational profile of the drone as outlined below. A graphical representation of the operational profile is presented in **Figure 3** and each phase is summarized in **Table 1**.

### Takeoff, Vertical Ascent, Transition, and Outbound Climb

The drone departs from the launch pad once cleared for takeoff. It will ascend vertically to the transition altitude of 115 feet AGL in vertical flight mode.

Upon reaching the transition altitude, and while still positioned above the launch pad, the drone transitions from zero speed to its cruise speed of 58.3 knots and continues an outbound climb to the typical cruise altitude of 200 feet AGL (ranges from 180 and 279 feet AGL). This transition is accompanied by a shift from vertical flight mode to horizontal flight mode.

### Fixed-wing Outbound Cruise

The drone proceeds to fly at the typical cruise altitude of 200 feet AGL (ranges from 180 to 279 feet AGL) and 58.3 knots to the backyard descent and transition.

### Backyard Descent, Delivery, Ascent, Transition, and Inbound Climb

The drone decelerates from the en route speed of 58.3 knots and descends from the typical outbound cruise altitude of 200 feet AGL (ranges from 180 to 279 feet AGL) to a transition altitude of 140 feet AGL. The drone then transitions to vertical flight mode, where it will be positioned over the delivery point at zero speed.

The drone begins a vertical descent from the transition altitude to 13 feet AGL while maintaining position above the delivery point. Once at 13 feet AGL, the drone drops the package and ascends vertically back to the transition altitude of 197 feet AGL. The nearest allowable proximity of any individual, animal, or other obstacles to the delivery point during this maneuver is 16.4 feet.

Once at the transition altitude and positioned above the delivery point, the drone transitions from zero speed to en route speed while changing from vertical flight to horizontal flight and continues to climb to the typical inbound cruise altitude of 345 feet AGL (ranges from 279 to 377 feet AGL).

### Fixed-wing Inbound Cruise

The drone continues to fly at the typical en route altitude of 345 feet AGL (ranges from 279 to 377 feet AGL) and speed of 58.3 knots towards the PADDC.

### Landing Descent, Transition, Vertical Descent, and Landing

The drone decelerates as it approaches the PADDC and descends to the transition altitude of 197 feet AGL and where it transitions from horizontal flight to vertical flight, coming to a zero-speed position over its assigned landing pad.

The drone descends over its assigned landing pad in vertical flight until it touches down and shuts down the motors.

**Table 1. Representative Operational Profile by Phase of Flight**

Phase of Flight	Altitude (feet AGL)	Ground Speed (knots)	Duration (seconds)
Takeoff and Vertical Ascent	Ascent from 0 to 115	0	15
Transition and Outbound Climb	115 to 279	0 to 58.3	40
Fixed Wing Outbound Cruise	200 <sup>1</sup>	58.3	Variable <sup>3</sup>
Delivery Descent and Transition	Descent from 200 to 140	58.3 to 0	30
Backyard Descent	Descent from 140 to 13	0	27
Delivery	13	0	4
Backyard Ascent	Ascent from 13 to 197	0	30
Transition and Inbound Climb	Ascent from 197 to 377	0 to 58.3	40
Fixed-Wing Inbound Cruise	377 <sup>2</sup>	58.3	Variable <sup>3</sup>
Landing Descent and Transition	Descent from 377 to 197	58.3 to 0	30
Vertical Descent and landing	Descent from 197 to 0	0	35

SOURCE: Amazon Prime Air, February 2025

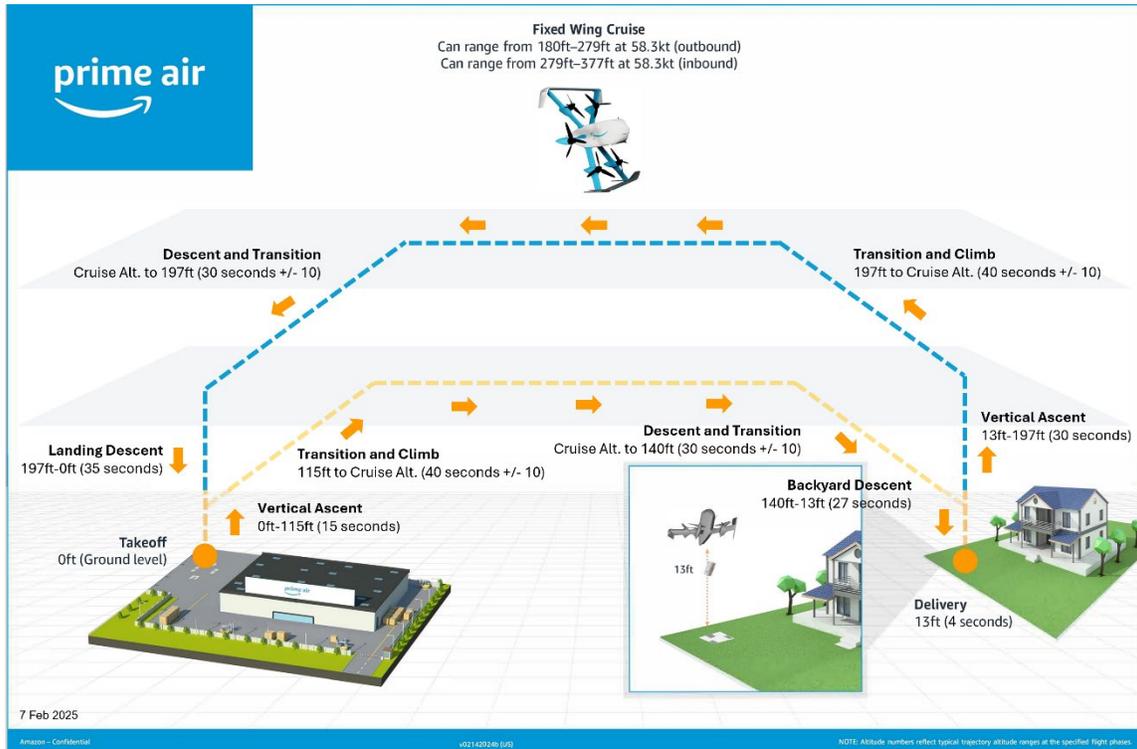

Notes:

<sup>1</sup> The outbound enroute altitude may range from 180 – 279 feet. For this analysis the outbound cruise altitude was assumed to be 200 feet.

<sup>2</sup> The inbound enroute altitude may range from 279 – 377 feet. For this analysis the inbound cruise altitude was assumed to be 345 feet.

<sup>3</sup> Duration of inbound and outbound cruise flight time varies based on distance to customer.

Figure 3. Representative Operational Profile of the MK30

### 3 Methodology

As previously mentioned, there is not a standardized process for drone noise assessments. Therefore, ESA is applying technical guidance that was previously approved by the FAA Office of Environment and Energy for past analyses. The following subsections outline this methodology.

Prime Air conducted noise measurements of the MK30 drone in October 2024 at the Pendleton UAS Range located at the Eastern Oregon Regional Airport (KPDT). ESA, in coordination with the FAA, processed and analyzed the measurement data and calculated the noise levels for each of the flight phases.<sup>5</sup> The following subsections show either the A-weighted Sound Exposure Levels (SEL) or formulas to calculate the SELs used for this analysis, which can be matched to each flight phase detailed in **Table 1**.

#### 3.1 Daytime Equivalent Operations and DNL

As mentioned, results are presented as DNL which applies a 10 dB weighting, or equivalent to 10 times the number of nighttime operations, for operations between 10:00 P.M. and 7:00 A.M. Therefore, the operations near point *i* can be weighted to develop a daytime equivalent number of operations ( $N_{equiv,i}$ ).

<sup>5</sup> Prime Air MK30 Drone Noise Measurement Report, Environmental Science Associates, April 2025. (See Attachment B).

$$eq. 1. N_{Equivalent,i} = W_{Day} \times N_{Day,i} + W_{Eve} \times N_{Eve,i} + W_{Night} \times N_{Night,i}$$

Where:

- $N_{Day,i}$  is the number of user-specified operations between 7 A.M. and 7 P.M. local time
- $N_{Eve,i}$  is the number of user-specified operations between 7 P.M. and 10 P.M. local time
- $N_{Night,i}$  is the number of user-specified operations between 10 P.M. and 7 A.M. local time
- $W_{Day}$  is the day-time weighting factor, which is 1 operation for DNL
- $W_{Eve}$  is the evening weighting factor, which is 1 operation for DNL
- $W_{Night}$  is the night-time weighting factor, which is 10 operations for DNL

The number of daytime equivalent operations,  $N_{DNL,i}$  can be simplified to

$$eq. 2. N_{DNL,i} = N_{Day,i} + N_{Eve,i} + 10 \times N_{Night,i}$$

## 3.2 PADDC Infrastructure

Each PADDC accommodates four sets of launch and landing pads. In the context of this noise analysis, it is assumed that all operations would occur at one launch/landing pad, where it would be the closest to the noise-sensitive areas. This assumption is considered acoustically conservative. If the precise location of the nearest single launch or landing pad is unknown, the respective PADDC boundary should be used for the analysis.

## 3.3 Application of Acoustical Data

The summation of the SELs presented in subsequent sections are used to estimate the DNL for Prime Air's drone operations covered in this report. SEL results are detailed in the measurement report found in **Attachment B**.

For calculating SEL, four specific activities are considered:

- The drone taking off from the PADDC (includes transition between vertical and horizontal flight)
- En route travel of the drone in horizontal flight between the PADDC and the delivery point
- Delivery
- The drone landing at the PADDC (includes transition between vertical and horizontal flight)

### 3.3.1 Takeoff

The process for estimating SELs associated with takeoff as a function of distance from the PADDC is presented in Equation 3 and incorporates the parameters detailed in **Table 2**.

$$eq. 3. SEL = m \times \log_{10}(d) + b(dB)$$

Where:

- $d$  is the distance along the ground in feet between the drone and receiver
- $m$  and  $b$  are parameters provided in the tables below

**Table 2. Parameters for Estimating Takeoff Sound Exposure Level versus Distance**

Range for d (feet from launch pad)	m	b
20 to 76	-14.51	109.35
76 to 195	-13.51	107.46
195 to 372	-14.66	110.09
372 to 772	-17.08	116.32
772 to 1,205	-17.05	116.23
1,205 and greater	0.00	63.7

SOURCE: ESA, 2025.  
 Note: Distance is along ground from launch pad to receiver.

Application of the SEL is based on the position of the launch/landing pad, where it would be the closest to the noise-sensitive areas. However, if the exact location of the launch pad is not known, the outer boundary of the PADDC, at a point closest to the receiver, should be used as it considered to be acoustically conservative. It should be noted that the SEL values include the transition to horizontal flight and the acceleration to en route speed that would occur during the climb.

### 3.3.2 En Route

The anticipated outbound flight speed of the drone en route is 58.3 knots at a cruise altitude of 200 feet AGL. For inbound flight the anticipated cruise altitude is 345 feet AGL with the same 58.3 knot flight speed. As discussed in **Appendix B**, adjustments were applied to the measured data to account for how the varying speed impacts the duration of the overflight at the stationary receptor.

As shown in **Table 3**, the SEL is 63.7 dB when the drone is at maximum weight, at 200 feet from the stationary receiver and traveling at approximately 58.3 knots. The SEL is 60.9 dB when the drone is at empty weight, 345 feet from the stationary receiver, and traveling at approximately 58.3 knots.

**Table 3. Estimates of En Route Sound Exposure Level**

Aircraft Configuration	Reference Air Speed (knots)	Reference Altitude (feet AGL)	Uncorrected Speed (knots)	Uncorrected Altitude (feet AGL)	Uncorrected SEL (dBA)	Corrected SEL (dBA)
Maximum Weight	58.3	200	60.8	116	66.1	63.7
Empty Wight	58.3	345	60.8	98	66.9	60.9

SOURCE: ESA, 2025.

### 3.3.3 Delivery

The process for estimating SELs associated with delivery as a function of distance from a receiver relative to the position of the delivery point is presented in Equation 3 and incorporates the parameters detailed in **Table 4**.

**Table 4. Parameters for Estimating Delivery Sound Exposure Level versus Distance**

Range for d (feet from launch pad)	m	b
25 to 76	-13.18	110.56
76 to 175	-18.65	120.84
175 to 372	-13.86	110.11
372 to 772	-15.63	114.67
772 to 1,820	-15.63	114.65
1,820	0.00	63.7

SOURCE: ESA, 2025.  
Note: Distance is along ground from delivery point to receiver.

The minimum distance used for calculation between the delivery point and a person is 16.4 feet.<sup>6</sup> The values in **Table 4** are valid for distances from the delivery point of 25 feet or greater. SEL values for distances between 16 and 25 feet are adjusted by distance to the delivery point and sound level adjustment of a stationary source as provided by Equation 4.

$$eq. 4. SEL_{Delivery} = 92.1 + 12.5 \times \log_{10} \frac{25}{Distance \text{ from Delivery Point (ft)}}$$

It should be noted that the SEL values include the noise contribution from the horizontal flight associated with the drone transition from en route to descent and transition, including the transition to vertical flight and transition back to en route altitude.

### 3.3.4 Landing

The process for estimating SELs associated with landing as a function of distance from the PADDC is presented in Equation 3 and incorporates the parameters detailed in **Table 5**.

**Table 5. Parameters for Estimating Landing Sound Exposure Level versus Distance**

Range for d (feet from launch pad)	m	b
20 to 76	-14.95	111.28
76 to 195	-16.17	113.58
195 to 375	-21.10	124.86
375 to 1,074	-21.10	124.87
1,074	0.00	60.9

SOURCE: ESA, 2025.  
Note: Distance is along ground from launch pad to receiver.

If the location of the landing pad is known, the outer boundary of the PADDC (at a point closest to the noise sensitive receiver), should be used for the modeling location as a conservative approach. It should be noted that the SEL values include the descent from en route altitude and the deceleration from en route speed, and the transition to vertical flight that would occur after the initial descent.

<sup>6</sup> Prime Air’s safety guidance stipulates that there should not be a person, animal or object within 5 meters of the delivery point, and if the drone detects a person, animal or object within 5 meters of the delivery point, it will abort the delivery.

## 3.4 DNL Estimation Methodology

The number of operations flying over a specific receiver's ground location will fluctuate depending on the proposed operating area and demand. For a given receiver location,  $i$ , and a single instance of sound source,  $A$ , the SEL for that sound source  $SEL_{iA}$  is (energy) summed for the average annual daily number of DNL daytime equivalent operations ( $N_{DNL,iA}$ ) to compute the equivalent DNL in Equation 5.

$$eq. 5. DNL_{iA} = SEL_{iA} + 10 \times \text{Log}_{10}(N_{DNL,iA}) - 49.4, dB$$

The above equation applies to an SEL value representing one noise source such as a drone takeoff or landing. For cases where a receiver would be exposed to multiple noise sources (e.g. takeoff, transiting, en route, and departure), the complete DNL at that point was calculated with Equation 6.

$$eq. 6. DNL_i = 10 \times \text{Log}_{10} \left( 10^{\left(\frac{DNL_{ia}}{10}\right)} + 10^{\left(\frac{DNL_{ib}}{10}\right)} + \dots + 10^{\left(\frac{DNL_{iz}}{10}\right)} \right), dB$$

For each of the conditions presented below, results are presented in tabular format based on the equivalent daytime operations, in DNL daytime equivalent, for the estimated DNL. The proper output of DNL is dependent on the calculation of respective daytime equivalent operations.

### 3.4.1 DNL at PADDCC

The takeoff and landing operations are anticipated to occur at one PADDCC for this analysis. Therefore, the results at the PADDCC will be calculated for a single set of receptors. Operations were assumed to takeoff and land along the same flight path.

Takeoff operations are represented by two phases of flight. The drone will take off and climb to the transition altitude as discussed in **Section 2**. The drone will then transition from vertical flight to horizontal flight and accelerate to en route speed of 58.3 knots and climb to en route altitude.

Landing operations are also represented by two phases of flight. The drone flies to the PADDCC at en route altitude until it begins to descend to the transition altitude while slowing down and transitions from horizontal to vertical flight as described in **Section 2**. Then the drone descends from the transition altitude to the ground and shuts down.

The two noise sources representing the complete takeoff and landing cycle associated with a single delivery departing and returning at the PADDCC were added together using Equation 6.

### 3.4.2 DNL for En Route

A receiver will be positioned directly under the flight path, and the DNL will be calculated based on the altitude and speed-adjusted delivery SEL presented in **Table 3**. The number of operations would be based on relevant materials and assume that a drone directly overflies the receiver while at maximum and empty weight for outbound and inbound flight, respectively, for a single delivery. The en route outbound and inbound noise level are added together with Equation 6.

### 3.4.3 DNL for Delivery Points

Delivery operations are represented by the deceleration of the drone from en route speed and transition from horizontal flight to vertical flight over the delivery point at the transition altitude of 140 feet AGL. The drone then begins a vertical descent to where the package is dropped at the delivery point at 13 feet AGL. The drone then climbs back to the transition altitude of 197 feet AGL where it will transition from vertical flight to horizontal flight, accelerating to en route speed.

## 4 Estimated Noise Exposure

This section outlines the estimated noise exposure for Prime Air's proposed operations for any given number of average annual day (AAD) deliveries. Results are based off the estimated number of DNL equivalent deliveries associated with the PADDC and presented in tabular format. Deliveries will not occur during nighttime hours (10 P.M. – 7 A.M.). Note that one delivery includes the outbound takeoff and inbound landing and is representative of two operations.

The DNL equivalent deliveries,  $N_{DNL,i}$  as described in **Section 4.1**, is presented below as Equation 7.

$$eq.7. Deliveries_{DNL,i} = Deliveries_{Day} + 10 \times Deliveries_{Night}$$

$Deliveries_{Day}$  are between 7 A.M. and 10 P.M. and  $Deliveries_{Night}$  are between 10 P.M. and 7 A.M. If a portion of a delivery (either takeoff or landing) occurs in the nighttime hours, then it is counted within  $Deliveries_{Night}$ .

For estimating noise exposure, the noise levels for each flight phase are considered separate based on the level of proposed operations for a given location. When a particular receptor is at the transition of different flight phases, the noise exposure is then determined by adding the noise from each phase.

### 4.1 Noise Exposure for Operations at the PADDC

For operations at the PADDC, noise generated by the drone includes takeoff, landing, and transitions from vertical to horizontal flight within the corresponding flight phases. It was assumed that all operations follow the same en route flight path, with outbound and inbound flights traversing it in opposing directions for a conservative approach.

**Table 6** presents estimated extent of noise exposure for the number of average daily DNL equivalent deliveries (including the takeoff and climb, transition to en route outbound, transition from en route inbound, and descent and landing as detailed in **Section 2**) under the flight path for the PADDC. The analyses presented were rounded up conservatively to the nearest interval available from the data outlined in this section.

**Table 6. Estimated Extent of Noise Exposure from PADDC per Number of Deliveries**

Number of DNL Equivalent Deliveries		Estimated Extent of Noise Exposure (feet)				
Average Daily	Annual	DNL 45	DNL 50	DNL 55	DNL 60	DNL 65

SOURCE: ESA, 2025.

Notes:

1. One delivery accounts for the outbound takeoff and inbound landing and is representative of two operations.
2. If a value for deliveries is not specifically defined in this table, use the next highest value. For example, if there are 50 average daily DNL equivalent deliveries, use the entry for 60 average daily DNL equivalent deliveries.
3. The DNL noise level extends more than 1,074 feet from the PADDCC based on the level of operations specified as the aircraft continues along its en route flight path. En route results in Section 4.2 may be more applicable in these instances for determining noise levels.

## 4.2 Noise Exposure under En Route Paths

When the drone is en route, it is expected to fly the same outbound flight path between the PADDCC and the delivery point and inbound flight path back to the PADDCC. Therefore, each receiver under the en route path would experience two overflights for each delivery served by the corresponding en route flight path.

**Table 7** provides the estimated DNL for a receiver on the ground directly under an en route path for various counts of daily average DNL equivalent deliveries. The en route noise calculated for each delivery includes both the outbound traversal of the en route path at 200 feet AGL and a ground speed of 58.3 knots and the inbound traversal of the en route path at 345 feet AGL and the same ground speed of 58.3 knots.

The drone may overfly locations at operational levels that differ from both an inbound and outbound traversal of the en route path by the drone as described above and presented in **Table 7**. For these circumstances, **Table 8** presents the equations for calculating the estimated DNL for a receiver directly under a specified given number of DNL equivalent average daily individual overflights, defined as  $N_o$ .

**Table 7. Estimated Noise Exposure Directly Under En Route Flight Paths**

345 feet AGL	60.7	11.5	$10 \times \log_{10}(No) + 11.5$
N Feet AGL	$12.5 \times \log_{10}(200/N_{ft}) + 63.7$	$SEL_1 - 49.4$	$10 \times \log_{10}(No) + DNL_1$

SOURCE: ESA, 2025.

Notes:

1. The DNL value for a given number of average DNL Equivalent Operations,  $N_o$ , can be found by using the equations associated with operation of the drone at a specified altitude and speed interval. In this case, one operation represents a single overflight.

2. All values in this table are for level flight at maximum weight and 58.3 knots.

### 4.3 Noise Exposure for Operations at Delivery Point

**Table 9** presents the estimated DNL values for a range of potential daily average DNL equivalent delivery counts at a delivery point. The DNL values include the transition from en route speed to vertical flight at transition altitude, the delivery maneuver, and the transition from vertical flight at transition altitude to en route speed as discussed in **Section 3.4.3**. The minimum listener distance is 16.4 feet from the delivery point and corresponds to minimum distance between a person and delivery point. Values are also presented at 25 feet from the delivery point which corresponds to minimum distance from the available measurement data and analysis. Values were also calculated at distances

of 50 feet, 75 feet, 100 feet, and 125 feet from the delivery point and are representative of distances from which nearby properties may experience noise from a delivery.<sup>7</sup>

**Table 9. Estimated Noise Exposure at Various Distances from a Delivery Point per Number of DNL Equivalent Deliveries**

Subject: Environmental Assessment (EA) Noise Methodology Approval Request for Amazon Prime Air Commercial Package Delivery Operations with the MK30 Unmanned Aircraft (UA) from Detroit, Michigan

---

---

The Office of Environment and Energy (AEE) has reviewed the proposed non-standard noise modeling methodology to be used for Amazon Prime Air (Amazon) operations using the MK30 unmanned aircraft (UA) from Detroit, Michigan. This request is in support of an Environmental Assessment (EA) for Amazon to provide package delivery services as a 14 CFR Part 135 operator in Detroit and surrounding operating areas.

The Proposed Action is for Amazon to use the MK30 UA to conduct package delivery operations under its existing Part 135 air carrier certificate from four Prime Air Drone Delivery Centers (PADCCs) to potential delivery locations such as residential homes within a set of four proposed operating areas in Detroit. Typical operations of the MK30 UA will consist of departure from a launch/takeoff pad at the PADCC followed by a vertical climb to a typical en route altitude of 180 to 377 feet above ground level (AGL). The UA then transitions from vertical to horizontal wing borne flight (WBF) for transit to a delivery location. Approaching the delivery location, the UA will transition from horizontal WBF to vertical flight, and then descend vertically over the delivery point. At 13 feet AGL, the UA drops the package at the delivery point, and ascends vertically back to en route altitude. Once back at en route altitude, the UA again transitions from vertical to horizontal WBF for transit back to its originating PADCC. When the UA arrives at the PADCC, the UA will transition from horizontal WBF to vertical flight and vertically descends to its assigned landing pad. Once it lands, the UA is serviced and prepared for the next delivery.

Under the scope of the Proposed Action Amazon projects conducting a maximum of 365,000 annual deliveries during daytime hours, no nighttime flights (10 PM – 7 AM), with 1,000 total deliveries on an average annual daily (AAD) basis at each of the four PADCC's and associated operating areas. Based on those overall levels Amazon expects deliveries to be distributed among delivery locations with a minimum number of 0.1 deliveries per day or less and maximum of 4.0 per day at any one location within the proposed operating area on an AAD basis.

As the FAA does not currently have a standard approved noise model for assessing UA, and in accordance with FAA Order 1050.1F, all non-standard noise analysis in support of the noise impact analysis for the National Environmental Policy Act (NEPA) must be approved by AEE. This letter serves as AEE's response to the method developed in ESA Report No. 202200549.04 for the "Estimated Noise Levels for Amazon Prime Air MK30 Drone Technical Noise Report" dated April 2025.

The proposed methodology appears to be adequate for this analysis; therefore, AEE concurs with the methodology proposed for this project. Please understand that this approval is limited to this particular Environmental Review, location, vehicle, and circumstances. Any additional projects using this or other methodologies or variations in the vehicle will require separate approval.

Subject: Environmental Assessment (EA) Noise Methodology Approval Request for MK-30 Amazon Prime Air Operations in Detroit, MI

---

---

AFS requests AEE approval of the noise methodology to be used for the Environmental Assessment (EA) for Amazon Prime Air (Amazon) operations using the Amazon MK30 unmanned aircraft (UA) in Detroit, MI to expand its package delivery services as a 14 CFR Part 135 operator as described below.

As required under the National Environmental Policy Act (NEPA), the FAA must consider the potential for environmental impacts in informing the agency's decision to approve Federal actions, including the potential for noise impacts as detailed in FAA Order 1050.1F.

As the FAA does not currently have a standard approved noise model for UA, this letter serves as a request for written approval from AEE to use the methodology proposed in the following sections to support the noise analysis for the EA.

### Description of Aircraft and Proposed Operations

AFS is evaluating Amazon's proposal to conduct package delivery operations from four Prime Air Drone Delivery Centers (PADCCs) located in Detroit, MI and associated operating areas under its existing Part 135 air carrier certificate and related operating authorizations using the MK30 UA. Amazon is proposing to perform package delivery operations within the proposed Detroit, MI operating areas to transport packages to delivery sites including residential homes.

The MK30 UA has six (6) propulsors allowing it to take-off and land vertically and transition to wing borne flight (WBF). Its airframe is composed of staggered tandem wings for stable WBF. The drone weighs 77.9 lbs. (35.5 kg) and has a maximum takeoff weight of 83.2 lbs. (37.8 kg), which includes a maximum payload of 5 lbs. (3 kg). It has a maximum operating range of 7.5 mi (12 km). It is a hybrid multicopter fixed-wing UA that uses electric power from rechargeable lithium-ion batteries and can fly

up to 400 ft (122 m) above ground level (AGL) at a maximum cruise speed of 73 mph (64 knots) during WBF. It is launched vertically using powered lift and converts to using wing lift during en route flight. A typical flight profile can be broken into the following general flight phases: launch, en route outbound, delivery, en route inbound, and landing. After launch, Amazon's MK30 UA would rise to an altitude of less than 400 ft (122 m) AGL and follow a predefined route to its delivery site.

Aircraft would typically fly en route at between approximately 180 to 377 ft (55 to 115 m) AGL, except when descending to drop a package. Packages would be carried internally in the UA's fuselage. When making a delivery, the UA descends, opens a set of payload doors, and drops the package to the ground from approximately 13 ft (4 m) AGL.

Amazon's UA would not touch the ground in any place other than the PADDC (except during safe contingent landings) and will remain airborne throughout the operation including the delivery stage. After the package is dropped, the MK30 UA climbs vertically and follows its predefined route back to the PADDC at its assigned altitude.

Amazon is seeking to amend its current Operation Specifications (OpSpec) and other Federal Aviation Administration (FAA) authorizations needed to integrate the MK30 and expand drone commercial package delivery operations.

Prime Air anticipates operating up to 1,000 delivery flights per operating day, up to 10 hours per day, and 7 days per week, from each of the four PADDCs. These operational levels would result in a projected total of approximately 365 operating days and 365,000 delivery operations per year for each PADDC, based on the scope of the Proposed Action. The operations would occur between 7 A.M. and 10 P. M. and are anticipated to be distributed evenly across each operating area. The MK30's proposed operating range is 7.5 mi from each PADDC, with a potential operating area of 174 sq mi. The drone departure and arrival paths from and to each PADDC would generally correspond to the geographical location of the package delivery address. Based on those overall levels Amazon expects deliveries to be distributed among delivery locations throughout the operating area with a minimum number of 0.1 deliveries per day or less and maximum of 4.0 per day at any one location on an AAD basis.

### **Noise Analysis Methodology**

AFS requests to use the noise analysis methodology described in ESA Report No. 202200549.04 for the "Estimated Noise Levels for Amazon Prime Air MK30 Drone Technical Noise Report" dated April 2025.

# 1 Introduction

This document details Amazon Prime Air's (Prime Air's) recent National Environmental Policy Act (NEPA) Noise Data Collection Campaign, aimed at estimating the noise signature of the MK30 drone. The collected data will be used to evaluate operations under NEPA. The test campaign took place at the Pendleton UAS Range, situated at the Eastern Oregon Regional Airport (KPDT) in Pendleton, Oregon. The data analyzed in this report comes from flights conducted on October 11, 12, 15, 16, 19, and 23, 2024.

Prime Air's package delivery operations are managed through a network of Prime Air Drone Delivery Centers (PADDCs). Each PADDC serves a specific area, preventing an over-concentration of flights around any single center. The MK30 drone has a round-trip range of approximately 15 miles. PADDCs are strategically located in established, and planned development, parking lots of Amazon Prime warehouses, and adhere to local zoning and land use regulations.

The MK30 is an electric powered drone that uses a vertical take-off and landing (VTOL) then transitions to fixed-wing flight using wing lift during en route flight. The drone systems include hardware and software designed for safety and efficiency. The airframe is composed of staggered wings, the propulsion system includes a rechargeable lithium-ion battery, and six (6) motors that include propellers designed for noise reduction. The package delivery system contains the package in a two-door interior receptacle, and a camera and avionics system that has redundancy for critical systems. The drone weighs approximately 78 lbs. and has a maximum takeoff weight of 83.2 lbs., which includes a maximum payload of 5 lbs. It has a maximum operating range of 7.5 mi and can fly up to 400 ft above ground level (AGL) at a maximum cruise speed of 73 mph (64 knots) during horizontal flight. An image of the MK30 drone is shown in **Figure 1**.

The MK30 operational flight profiles can be broken into the following general flight phases: launch, en route outbound, delivery, en route inbound, and landing. After launch, the MK30 would ascend to an altitude of less than 400 ft AGL and follow a predefined route to its delivery site.<sup>1</sup> The MK30 would typically fly en route at between approximately 180 to 377 ft AGL, except when descending to drop a package. Packages would be carried internally in the drone's fuselage. When making a delivery, the drone descends, opens a set of payload doors, and drops the package to the ground from approximately 13 ft AGL. Prime Air's drone would not touch the ground in any place other than the PADDC (except during safe contingent landings) and will remain airborne throughout the operation including the delivery stage.<sup>2</sup> After the package is dropped, the MK30 drone climbs vertically and follows its predefined route back to the PADDC at its assigned altitude. The typical operational flight parameters can be seen below in **Table 1** and **Figure 2**. Note that these are the flight profiles for operational flights and not the flight test profiles for this noise flight test campaign.

---

<sup>1</sup> Prime Air may modify operations, if warranted, to avoid or minimize any negative impacts.

<sup>2</sup> The MK30 vehicle is built with multiple redundant safety features and "detect and avoid" technology. The drone is designed to handle unexpected situations; it is independently safe.

A custom measurement system was utilized, employing GRAS 46AO 1/2" pressure microphones and National Instruments data acquisition hardware, following the FAA's draft UA package delivery noise measurement protocol.<sup>3</sup> Flights were conducted across three flight profiles, which included takeoff/landing/delivery, hover, and overflight, to characterize the sound exposure levels (SEL) of the MK30 drone. These SEL values will be a key input to the NEPA Environmental Assessment for assessing the potential noise impact of Prime Air's proposed drone package delivery operations.

**Table 1. Phases of Flight for Typical Flight Profile of the MK30 Drone**

Phase of Flight	Altitude (feet AGL)	Ground Speed (knots)	Duration (seconds)
Takeoff and Vertical Ascent	Ascent from 0 to 115	0	15
Transition and Outbound Climb	115 to 200	0 to 58.3	40
Fixed Wing Outbound Cruise	200 <sup>1</sup>	58.3	Variable <sup>3</sup>
Delivery Descent and Transition	Descent from 200 to 140	58.3 to 0	30
Backyard Descent	Descent from 140 to 13	0	27
Delivery	13	0	4
Backyard Ascent	Ascent from 13 to 197	0	30
Transition and Inbound Climb	Ascent from 197 to 345	0 to 58.3	40
Fixed-Wing Inbound Cruise	377 <sup>2</sup>	58.3	Variable <sup>3</sup>
Landing Descent and Transition	Descent from 345 to 197	58.3 to 0	30
Vertical Descent and landing	Descent from 197 to 0	0	35

Source: Prime Air, 2025.

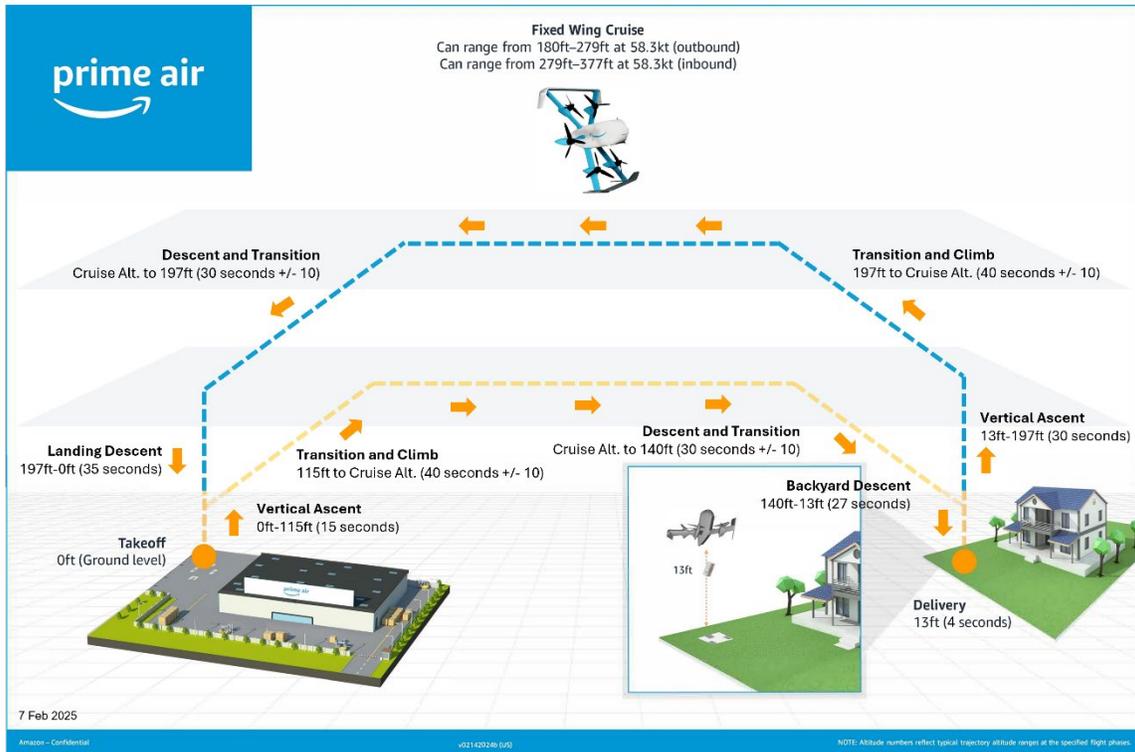

Notes:

<sup>1</sup> The outbound enroute altitude may range from 180 – 279 feet. For this analysis the outbound cruise altitude was assumed to be 200 feet.

<sup>2</sup> The inbound enroute altitude may range from 279 – 377 feet. For this analysis the inbound cruise altitude was assumed to be 345 feet.

<sup>3</sup> Duration of inbound and outbound cruise flight time varies based on distance to customer.

## 2 Test Descriptions

### 2.1 Overview

This section describes the methodology utilized to characterize the noise signature of the MK30 drone. The following sections describe the measurement system, and detailed description of the test plan, including flight trajectories and microphone locations.

### 2.2 Measurement System

Prime Air utilized a proprietary Mobile Acoustic Noise Test Array (MANTA) system for experimental measurements. This system provides time synchronized audio with respect to the drone. Microphone locations are surveyed for accurate positioning. The audio, drone-synchronized time and location data allow accurate determination of sound pressure level (SPL), distance, and incidence angle required for post-processing.

The system is composed of commercially available hardware with internal and external calibrations. The data acquisition system (DAQ) is a series of daisy-chained National Instruments cDAQ-9185 units and cDAQ-9189 units with NI-9234 analog modules capable of 51.2 kHz sampling rate at 24-bit resolution. New and calibrated GRAS 46AO ½” CCP Pressure Standard Microphones were used with the factory sensitivity values for the test. Calibration tones of the microphones were collected using a GRAS 42AG sound calibrator with a 1000 Hz signal at 114dB at the start and completion of each flight. Sensitivity values can be found in **Table 2**. While the primary components of the system are detailed above, the complete system hardware can be found in **Table 3**.

Measurement accuracy can be decomposed into system and field-installation components. Although MANTA has a GPS assigned to each microphone unit, only the time solution is used in the final product. By assigning a separate GPS unit to each microphone, the system is able to time synchronize with the on-board vehicle system to within 1 ms accuracy. Although the GPS location solution is not part of the delivered data product, it is used to confirm microphone placement with respect to desired survey locations using a nearest neighbor algorithm. This reduces geographic microphone placement from  $\pm 1$  m to  $\pm 5$  mm before installation error. When including a  $\pm 30^\circ$  installation error via a 1.6m tall tripod on non-level ground, horizontal and vertical location accuracy approach  $\pm 0.8$ m and  $\pm 0.1$ m, respectively.

**Table 2. Microphone Data**

Microphone ID	Hardware	Serial Number	Sensitivity (mV/Pa)
00	GRAS 46AO	573631	10.77
01	GRAS 46AO	573508	9.47
02	GRAS 46AO	573632	11.60
03	GRAS 46AO	573507	12.54
04	GRAS 46AO	573633	10.81
05	GRAS 46AO	573636	10.41
06	GRAS 46AO	573506	11.12
07	GRAS 46AO	573505	12.78
08	GRAS 46AO	573504	9.39
08	GRAS 46AO	573504	9.39
10	GRAS 46AO	573521	10.10

Note: All cDAQs were daisy chained together and utilized the Time-Sensitive Networking protocol to keep all data synchronized.

## 2.3 Microphone Locations

The microphone setup consisted of 13 pressure field microphones. In accordance with the FAA guidelines, each microphone was placed at 90 degree incidence to the sound source (drone) and is illustrated in **Figure 3**. There were no corrections applied to the measurement data due to the orientation of the microphones.

As shown in **Table 4**, microphones 00-04 were located under the takeoff, delivery, and landing flight trajectory. Microphones 05-08 were located behind the flight trajectory. Microphones 09-12 were located lateral to the flight trajectory. The table identifies the microphones used in calculating the various flight profiles. **Figure 4** provides the layout of microphones over an aerial basemap.

**Figure 3. Microphone Orientation**

## 2.4 Test Limitations

The test plan consists of flights with a “dog-bone” and “half dog-bone” trajectory while the MANTA (detailed in 2.2) is positioned at the vicinity of the delivery/takeoff/landing PADDCC and along a parallel and perpendicular line to the flyover trajectory. Close-in and distant measurements were captured for all VTOL phases of flight.

Additionally, some phases of the test flight profiles were slightly modified from typical operations. The duration of the delivery backyard climb was, on average, 16 seconds shorter than expected for typical operation. During the test flight the drone also climbed to a lower altitude of approximately 200 feet AGL, compared to the typical 345-foot AGL ceiling. To adjust, noise measurements were manually added at the point just before the MK30 stops climbing, where the climb rate is constant, to account for the total missing duration.

Similarly, for the return to the PADDCC, the VTOL descent was, on average, 10 seconds shorter than typical operations. To adjust, noise measurements were manually added at the point just after the MK30 starts its vertical descent, where the descent rate is constant, to account for the total missing duration. Both adjustments provided a conservative (i.e., louder) approach to assessing noise exposure of the MK30.

## 3 Measurement Profiles

### 3.1 Overview

The noise measurement data for each test was reviewed and takeoff, delivery, landing, and overflight events were hand-selected for each test flight based on the drone’s altitude, speed, location, and distance from the PADDCC and MANTA. Events were reviewed for each test flight and each microphone in the MANTA was checked for data quality, and were discarded based on the following criteria:

- Ambient noise level of the microphone is not reasonably close to the other microphones in the MANTA array.
- Average wind speed exceeding 5 knots during the event.
- Maximum sound level as measured by the 1-second Leq time history of the noise event not exceeding 10 dBA above the ambient noise level.
- Suspected contamination of the noise data (e.g. elevated or inconsistent ambient, sharp spikes in noise level, etc.).
- For overflight tests, data from the undertrack microphones (parallel to the direction of flight) were discarded.

## 3.2 Flight Test Profiles

### 3.2.1 Takeoff – Delivery – Landing (VTOL)

Two sets of tests were conducted with the drone performing VTOL flights at the PADDC location at the center of the MANTA to simulate takeoff, delivery, and landing operations. A total of six test flights were measured with the drone carrying no payload, and an additional seven test flights were measured with the drone carrying maximum payload. For each of these test flights the drone was flown in a “half dog-bone” flight pattern, as shown in **Figure 5**. As depicted, the drone takes off from the PADDC, and heads west before making a righthand turn through a full 270 degrees while attaining a cruise altitude of approximately 200 feet AGL. The drone then makes a left-hand 90 degree turn to re-align with the outbound flight path while descending back to PADDC elevation. The drone performs this flight pattern twice per test flight. The first outbound leg represents the takeoff phase of flight, the first inbound and second outbound legs combined represent the delivery phase of flight, and the second inbound leg represents the landing phase of flight. The drone only touches down after the second inbound leg representing the landing phase.

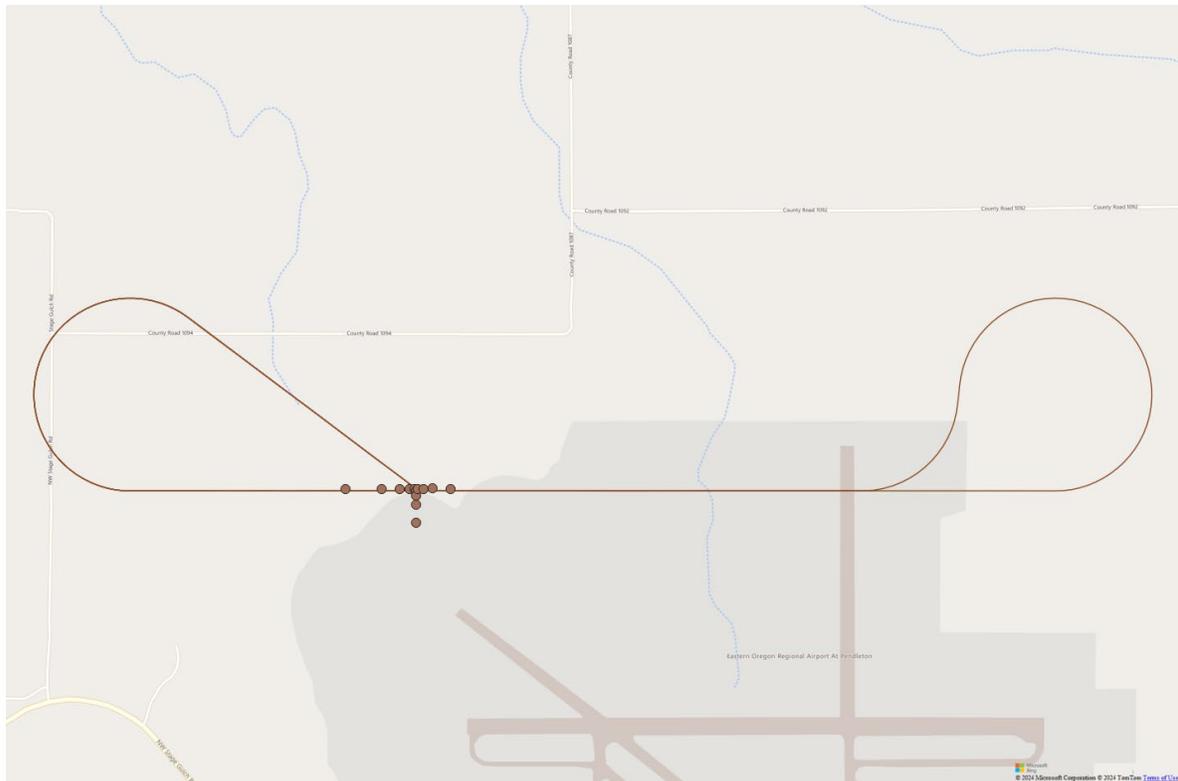

**Figure 5. Takeoff, Delivery, and Landing Flight Pattern (Empty and MTOW)**

### 3.2.2 Forward Flight (Flyover)

Two sets of tests were conducted with the drone overflying the MANTA to simulate an en route pass-by. A total of seven overflights were measured with the drone carrying no payload, and an additional six overflights were measured with the drone carrying maximum payload. For each of these overflights the drone was flown in a “dog-bone” flight pattern, as shown in **Figure 6**. As depicted, the drone takes off from the PADDC, heads northwest to transition and makes a lefthand turn while attaining a cruise altitude of 104 feet AGL at empty weight and 123 feet AGL at max weight.<sup>4</sup> It then flies over the MANTA, then performs another lefthand turn through a full 270 degrees before turning right 90 degrees to realign with the eastbound portion of the flight path before overflying the MANTA again, and finally reversing the original outbound route back to the PADDC. This maneuver was repeated for each flight in both the max and empty weight test scenarios.

**Figure 6. Flyover Flight Pattern (Empty and MTOW)**

<sup>4</sup> Empty and max weight en route flight tests were flown at different altitudes to ensure measurement was above ambient noise levels.

### 3.3 Test Condition: Takeoff (Max Weight)

#### 3.3.1 Weather Conditions

The average weather conditions for each test at max weight are shown in **Table 5**. There were no weather exceedances that would deem measurements invalid.

**Table 5. Takeoff (Max Weight) Weather Conditions**

Test Number	Temperature (°F)	Average Wind Speed (knots)	Wind Direction (Degrees)	Average Wind Gust Speed (knots)	Relative Humidity (%)
1	49.3	4.4	114	6.2	56.5
2	55.5	2.0	165	3.5	43.9
3	59.7	4.0	275	7.4	36.4
4	60.1	3.6	233	7.0	35.6
5	50.0	3.4	101	4.3	52.7
6	45.8	4.0	90	4.9	62.5
7	47.8	4.0	121	6.2	60.2

Source: Prime Air, 2024; ESA, 2025.

#### 3.3.2 Test Points and Validity

**Appendix B** and **Appendix C** present the tabulated and time history results, respectively, for all measurements. Out of the 91 data points, 17 were identified as invalid, as detailed in the **Table 6**. Therefore, 74 data points were deemed valid.

**Table 6. Takeoff (Max Weight) Excluded Measurements**

Microphone ID (position)	Test Number	Reason Not Included
Mic 00 (Undertrack)	7	Measurement too close to ambient
Mic 05 (Behind)	4	Elevated ambient levels across measurement
Mic 08 (Behind)	1, 5, 6, 7	Measurement too close to ambient
Mic 09 (Lateral)	1, 2, 3, 4, 5	Elevated ambient levels across measurement
Mic 12 (Lateral)	2, 3, 4, 5, 6, 7	Measurement too close to ambient

Source: Prime Air, 2024; ESA, 2025.

Notes: Measurement data that has been excluded under this noise analysis are presented in Appendix B and Appendix C.

### 3.4 Test Condition: Delivery (Max Weight)

#### 3.4.1 Weather Conditions

The average weather conditions for each test at max weight are shown in **Table 7**. There were no weather exceedances that would deem measurements invalid.

**Table 7. Delivery (Max Weight) Weather Conditions**

Test Number	Temperature (°F)	Average Wind Speed (knots)	Wind Direction (Degrees)	Average Wind Gust Speed (knots)	Relative Humidity (%)
1	49.1	4.1	123	6.0	56.6
2	55.6	1.2	260	3.7	43.5
3	59.8	5.0	283	7.4	36.3
4	60.3	4.6	222	6.2	35.2
5	50.6	2.9	92	4.3	52.3
6	45.8	4.5	93	4.9	62.8
7	47.9	4.2	112	6.2	59.7

Source: Prime Air, 2024; ESA, 2025.

#### 3.4.2 Test Points and Validity

**Appendix B** and **Appendix C** present the tabulated and time history results, respectively, for all measurements. Out of the 91 data points, 14 were identified as invalid, as detailed in **Table 8**. Therefore, 77 data points were deemed valid.

**Table 8. Delivery (Max Weight) Excluded Measurements**

Microphone ID (position)	Test Number	Reason Not Included
Mic 00 (Undertrack)	7	Elevated ambient levels across measurement
Mic 08 (Behind)	5, 6, 7	Measurement too close to ambient
Mic 09 (Lateral)	1, 2, 3, 4, 5	Elevated ambient levels across measurement
Mic 12 (Lateral)	2, 3, 4	Elevated ambient levels across measurement
Mic 12 (Lateral)	5, 6	Measurement too close to ambient

Source: Prime Air, 2024; ESA, 2025.

Notes: Measurement data that has been excluded under this noise analysis are presented in Appendix B and Appendix C.

### 3.5 Test Condition: Landing (Empty Weight)

#### 3.5.1 Weather Conditions

The average weather conditions for each test at empty weight are in **Table 9**. Test 3 wind speed exceeded the weather threshold for wind and would invalidate the measurement.

**Table 9. Landing (Empty Weight) Weather Conditions**

Test Number	Temperature (°F)	Average Wind Speed (knots)	Wind Direction (Degrees)	Average Wind Gust Speed (knots)	Relative Humidity (%)
1	51.5	3.4	309	6.8	61.3
2	62.4	1.2	298	6.0	33.0
3	61.4	5.2	321	7.8	34.7
4	59.9	3.4	271	5.2	44.6
5	42.6	4.8	118	5.6	83.0
6	56.8	1.0	108	2.1	51.1

Source: Prime Air, 2024; ESA, 2025.

### 3.5.2 Test Points and Validity

Appendix B and Appendix C present the tabulated and time history results, respectively, for all measurements. Out of the 78 data points, 35 were identified as invalid, as detailed in Table 10. Therefore, 43 data points were deemed valid.

**Table 10. Landing (Empty Weight) Excluded Measurements**

Microphone ID (position)	Test Number	Reason Not Included
Mic 00-12 (all)	3 <sup>1</sup>	Exceeds crosswind component
Mic 01	4	Elevated ambient levels across measurement
Mic 05	1, 4, 6	Elevated ambient levels across measurement
Mic 08	4, 5, 6	Elevated ambient levels across measurement
Mic 09	1, 6	Elevated ambient levels across measurement
Mic 10	2	Elevated ambient levels across measurement
Mic 12	2	Elevated ambient levels across measurement
Mic 00	1, 2, 4, 5, 6	Measurement too close to ambient
Mic 01	5	Measurement too close to ambient
Mic 08	1	Measurement too close to ambient
Mic 11	5	Measurement too close to ambient
Mic 12	1, 4, 6	Measurement too close to ambient

Source: Prime Air, 2024; ESA, 2025.

Notes:

Measurement data that has been excluded under this noise analysis are presented in Appendix B and Appendix C.

<sup>1</sup> Test 3 was invalid for all microphone positions and accounts for 13 data points.

## 3.6 Test Condition: Flyover (Empty Weight)

### 3.6.1 Weather Conditions

The average weather conditions for each test at empty weight are shown in **Table 11**. Test 3-1, 3-2, and 4-2 wind speeds exceeded the weather threshold for wind and would invalidate the measurement.

**Table 11. Flyover (Empty Weight) Weather Conditions**

Test Number	Temperature (°F)	Average Wind Speed (knots)	Wind Direction (Degrees)	Average Wind Gust Speed (knots)	Relative Humidity (%)
1-1	45.3	4.0	102	4.5	62.8
1-2	45.5	3.8	93	4.5	62.2
2-1	65.1	2.4	177	4.1	38.7
2-2	65.1	3.0	213	4.1	38.4
3-1	62.2	5.9	326.2	10.9	34.6
3-2	62.8	7.5	312.6	10.9	35.6
4-1	63.3	4.3	300	11.1	34.1
4-2	63.9	6.4	353.4	10.7	33.9
5-1	61.3	2.2	320	9.9	37.8
5-2	61.7	3.0	341	9.9	37.4
6-1	61.3	4.4	34	9.1	37.3
6-2	61.0	2.6	22	7.4	37.0
7-1	45.5	4.2	102	4.7	61.5
7-2	45.7	3.9	105	4.7	61.3

Source: Prime Air, 2024; ESA, 2025.

### 3.6.2 Test Points and Validity

**Appendix B** and **Appendix C** present the tabulated and time history results, respectively, for all measurements. Out of the 56 data points, 25 were identified as invalid, as detailed in **Table 12**. Therefore, 31 data points were deemed valid.

**Table 12. Flyover (Empty Weight) Excluded Measurements**

Microphone ID (position)	Test Number	Reason Not Included
Mic 09 - 12	3-1, 3-2, 4-2	Exceeds crosswind component
Mic 09	4-1	Measurement too close to ambient
Mic 10	6-2	Measurement too close to ambient
Mic 11	6-1	Elevated ambient levels across measurement
Mic 12	1-1, 1-2, 2-2, 4-1, 5-1, 5-2, 6-1, 6-2, 7-1, 7-2	Measurement too close to ambient

Source: Prime Air, 2024; ESA, 2025.

Notes: Measurement data that has been excluded under this noise analysis are presented in Appendix B and Appendix C.

## 3.7 Test Condition: Flyover (Max Weight)

### 3.7.1 Weather Conditions

The average weather conditions for each test at max weight are shown in **Table 13**. There were no weather exceedances that would deem measurements invalid.

**Table 13. Flyover (Max Weight) Weather Conditions**

Test Number	Temperature (°F)	Average Wind Speed (knots)	Wind Direction (Degrees)	Average Wind Gust Speed (knots)	Relative Humidity (%)
1-1	53.4	1.6	96.6	4.4	53.8
1-2	53.2	2.9	82.3	4.1	53.6
2-1	48.4	3.3	77.3	5.8	62.8
2-2	49.3	3.6	123.5	5.8	60.9
3-1	54.5	1.7	132.1	3.5	52.2
3-2	54.9	2.2	306.5	3.5	51.3
4-1	56.7	2.1	170.8	3.9	48.7
4-2	56.1	1.9	214.0	4.1	49.2
5-1	50.9	3.3	116.9	4.7	59.1
5-2	51.1	2.7	131.5	4.7	58.6
6-1	65.5	1.6	191.3	4.1	53.5
6-2	65.3	3.7	245.7	7.0	56.7

Source: Prime Air, 2024; ESA, 2025.

### 3.7.2 Test Points and Validity

**Appendix B** and **Appendix C** present the tabulated and time history results, respectively, for all measurements. Out of the 48 data points, 12 were identified as invalid, as detailed in **Table 14**. Therefore, 36 data points were deemed valid.

**Table 14. Flyover (Max Weight) Excluded Measurements**

<b>Microphone ID (position)</b>	<b>Test Number</b>	<b>Reason Not Included</b>
Mic 12	All	Measurement too close to ambient

Source: Prime Air, 2024; ESA, 2025.

Notes: Measurement data that has been excluded under this noise analysis are presented in Appendix B and Appendix C.

## 4 Measurement Analysis

A range of metrics were calculated for each event and at each microphone. These metrics include ambient noise level (defined as the noise level when the drone’s rotors are not powered), Leq, Maximum Sound Level (Lmax), and SEL. Additional parameters regarding flight performance and weather conditions were also considered. It should be noted that the empty weight takeoff and max weight landing cases are not used in any subsequent analyses.

### 4.1 Overflight Analysis

As noted in the previous section, only the microphones positioned perpendicular to the flight path were utilized for analyzing the overflight data. For each event and microphone, the measured SEL was adjusted using correction factors to normalize the noise to the speed and distances specified by Prime Air’s typical flight profile, as described in Section 1. **Table 15** below outlines the parameters used for normalization.

**Table 15. Enroute Normalization Parameters**

Test Case	Normalization Speed (knots)	Normalization Distance (ft)
Empty Weight	58.3	345
Max Weight	58.3	200

Source: Prime Air, 2024; ESA, 2025.

The SELs for each microphone were averaged and the highest resulting SEL was selected for use as the computed en route noise level. The results of this analysis are presented in **Table 16** below along with the undertrack distance and point of closest approach (POCA) slant distance. The most conservative empty-weight en route noise level was computed to be 61.0 dBA. The most conservative max-weight en route noise level was computed to be 63.9 dBA. **Figure 7** and **Figure 8** present the range of measured en route SEL’s for empty weight and max weight, respectively.

**Table 16. En Route Averaged A-Weighted SELs (Empty and Max Weight)**

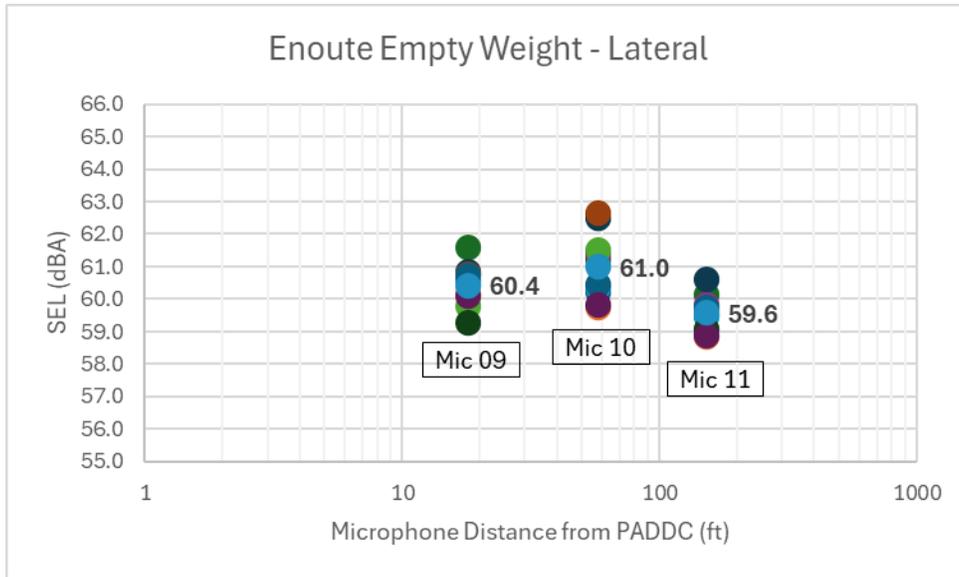

Test Case	Microphone ID (Position)	Undertrack Distance (ft)	POCA Slant Distance (ft)	Normalized SEL <sup>1</sup> (dBA)
Empty Weight	09 (Lateral)	18.4	99.3	60.4
	10 (Lateral)	57.8	112.8	60.9
	11 (Lateral)	152.8	180.8	59.1
Max Weight	09 (Lateral)	20.0	118.4	63.0
	10 (Lateral)	56.0	128.9	63.7
	11 (Lateral)	152.7	191.7	61.7

Source: Prime Air, 2024; ESA, 2025.

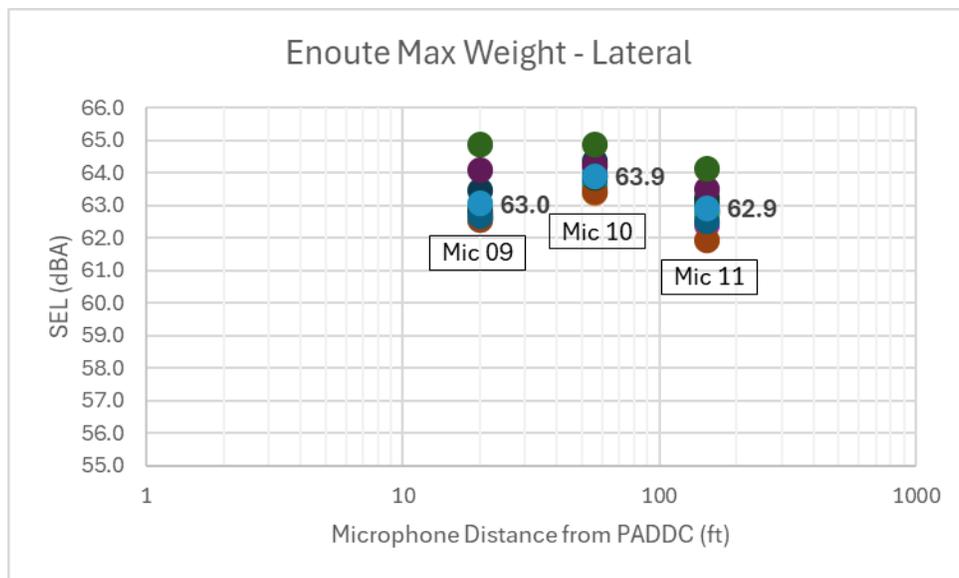

Notes: Microphone ID 12 (lateral) is excluded as results were not sufficiently above ambient noise levels.

<sup>1</sup> Measured levels normalized to 58.3 kts before averaging. Using  $12.5 \cdot \log_{10}(\text{POCA Slant} / \text{Normalized Adjustment Slant})$ ; empty weight normalized to 345 feet; max weight normalized to 200 feet.

**Figure 7. Range of MK30 Averaged A-Weighted SELs from En Route at Empty Weight**

**Figure 8. Range of MK30 Averaged A-Weighted SELs from En Route at Max Weight**

## 4.2 VTOL Analysis

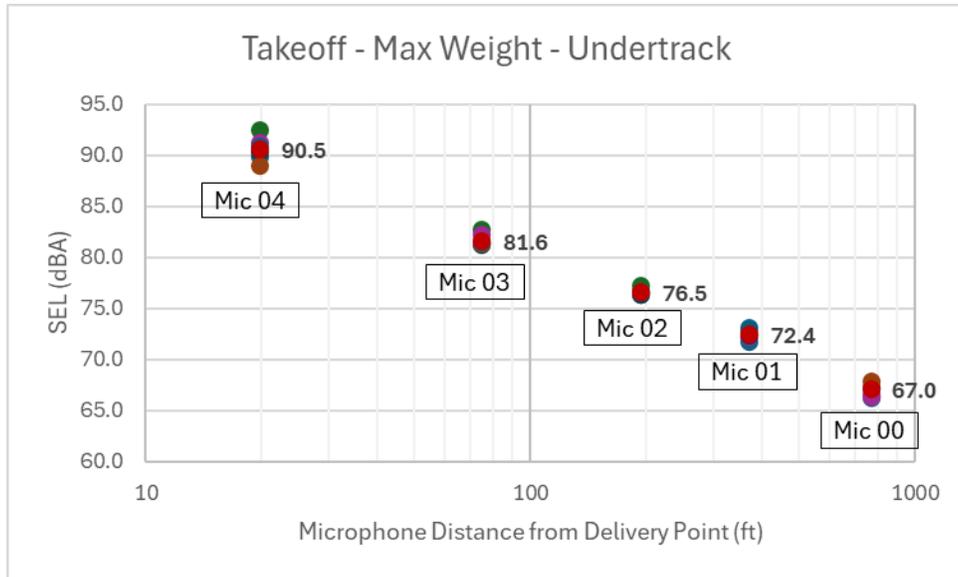

For each microphone and each test flight, the takeoff, delivery, and landing SELs were averaged. **Table 17** presents the results for takeoff, delivery, and landing. Scatter plots for these measurements are shown in **Figure 9** through **Figure 17**.

**Table 17. Takeoff, Delivery, and Landing Averaged A-Weighted SELs**

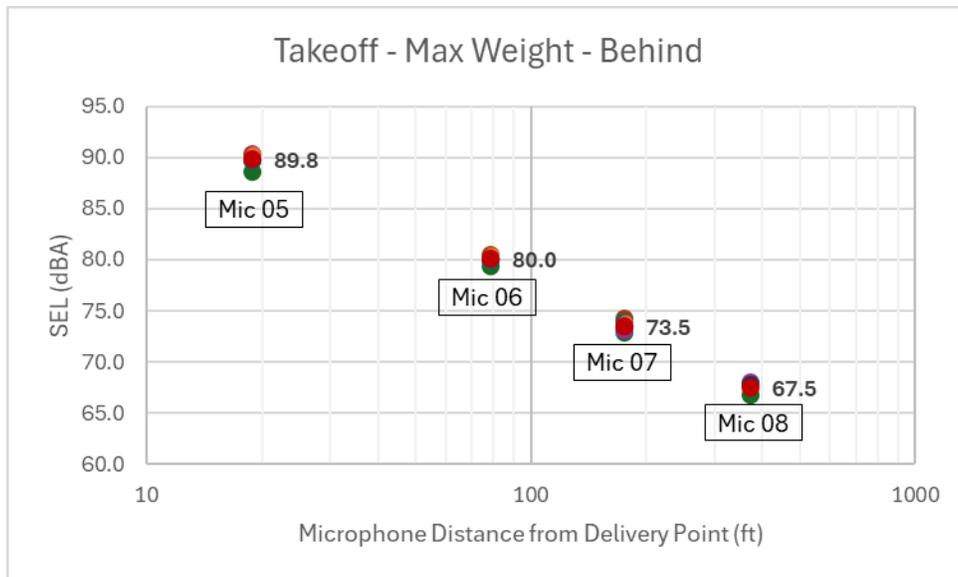

Distance to PADDCC (ft)	Max Weight		Empty Weight
	Takeoff	Delivery	Landing
<b>Undertrack</b>			
20	90.5	91.7	91.8
75	81.6	83.7	82.8
195	76.5	78.8	76.5
372	72.4	74.5	70.4

**Figure 16. Range of MK30 Averaged A-Weighted SELs from Delivery at Max Weight – Behind**

**Figure 17. Range of MK30 Averaged A-Weighted SELs from Delivery at Max Weight – Lateral**

The maximum SEL values from each test outline in **Table 17** were utilized to determine the composite, maximum A-weight SELs for takeoff, delivery, and landings, as shown in **Table 18** through **Table 20**. Additionally, speed- and altitude-corrected en route noise was factored in to calculate the interpolated distances to the PADDCCs. **Figure 18** illustrates the noise levels and corresponding distances associated with takeoff, delivery, and landing.

**Table 18. Maximum Takeoff A-Weighted SELs**

Figure 18. MK30 Maximum A-Weighted SELs

Using the maximum A-weight SELs from takeoff, delivery, and landing, parameters were determined to estimate SELs as a function of distance from the PADDAC launch pad and delivery location. **Table 21** provides parameters to estimate SELs associated with takeoff as a function of distance from the PADDAC launch pad to the receiver. **Table 22** provides parameters to estimate the SEL associated with delivery, as a function of distance from the delivery point to the receiver. **Table 23** provides parameters to estimate SELs associated with landing as a function of distance from the PADDAC launch pad to the receiver. In these tables, constants “m” and “b” are components of the slope intercept linear equation  $y = mx + b$ . Constant “m” represents the slope of the line. Constant “b” represents the point at which the slope crosses the y-axis.

Table 21. Parameters for Estimating Sound Exposure Level for Takeoff versus Distance

Range for Distance (feet from launch pad)	m	b
20 to 76	-14.51	109.30
76 to 195	-13.51	107.46
195 to 372	-14.66	110.09
372 to 772	-17.08	116.32
772 to 1,205	-17.05	116.23
1,205 and greater	0.00	63.7

Source: Prime Air, 2024; ESA, 2025.

Notes: Distance is along ground from launch pad to receiver.

**Table 22. Parameters for Estimating Sound Exposure Level for Delivery versus Distance**

<b>Range for Distance (feet from delivery point)</b>	<b>m</b>	<b>b</b>
25 to 76	-13.18	110.56
76 to 175	-18.65	120.84
175 to 372	-13.86	110.11
372 to 772	-15.63	114.67

Re: Federal Aviation Administration - Unmanned Aircraft Package Delivery Operations,  
FL202508040539C, Multiple Counties

Dear Mr. Stahl:

Florida Fish and Wildlife Conservation Commission (FWC) staff reviewed the above-referenced project and provides the following comments and recommendations for consideration in accordance with Chapter 379, Florida Statutes (F.S.), and pursuant to the federal National Environmental Policy Act (NEPA), the federal Coastal Zone Management Act, and the State of Florida Coastal Management Program.

### Project Description

The Federal Aviation Administration (FAA) has provided a request to review the proposal from Amazon.com Services, doing business as Prime Air, to introduce drone package delivery operations at six Prime Air Drone Delivery Centers (PADDCs) locations in the state of Florida, with each flight taking a package to a customer delivery address before returning to the PADDC. Each proposed PADDC would be located at an existing logistics facility currently operated by Amazon Services. Landing pads used to support drone operations, which would include inspections, maintenance, charging/replacing drone batteries, and loading packages for customer delivery, would occupy a small portion of the facility's existing footprint (e.g., an existing parking lot).

The six proposed drone operating areas are the focal point for delivery areas within a 7.5-mile radius associated with each PADDC. The locations of the proposed PADDC facilities in Central and Southeast Florida are:

- TPA1 – 3350 Laurel Ridge Avenue in Ruskin
- TPA4 – 8727 Harney Road in Tampa
- SFL1 – 7469 Kingspointe Parkway, # 300, in Orlando
- SFL3 – 6901 Hiatus Rd in Tamarac
- SFL6 – 1301 President Barack Obama Highway in Riviera Beach
- SFL9 – 3701 Flamingo Road in Miami

The drone model MK30 is specifically planned for use described in the proposal. The MK30 has 6 propellers, weighs approximately 80 pounds, and a wingspan of 5.5 feet. This model has a maximum operating range of 7.5 miles and can fly up to about 67 miles per hour (mph) during wing-borne flights. It uses electric power from rechargeable lithium-ion batteries and is launched vertically using powered lift and converts to using wing lift during horizontal flight. The MK30 is equipped with collision avoidance technology to help avoid conflicts with other aircraft and drones during flights.

Prime Air anticipates operating the MK30 drone up to 1,000 overflights per operating day, per PADDC, with operating hours occurring between 7:00 am to 10:00 pm, 7 days a week, including holidays. Each MK30 would fly at altitudes of between 180 and 377 feet at a speed of 67 miles

per hour. The takeoff and loading operations would occur at the PADDC and deliveries would involve the drone hovering at 13 feet Above Ground Level (AGL) for approximately 30 seconds. The estimated maximum sound exposure level (SEL) for takeoff, delivery, and landing for the MK30 is estimated at approximately 90.5 dB (at 20 feet), 92.1 dB (at 25 feet), and 91.8 dB (at 20 feet). Predicted sound levels decrease as distances from the drone increase. The maximum SEL for the en route phase is approximately 63.7 dB when the drone is at an altitude of 200 feet AGL and flying at approximately 67 mph.

### **Potentially Affected Resources**

No assessment of potential wildlife impacts was included in the project information provided. Based on the wide variety of landcovers and habitats surrounding each of the six project areas, FWC staff conducted a geographic information system (GIS) analysis of each area which determined the following listed and managed species may be impacted by the proposed activities:

- Least tern (*Sternula antillarum*, State Threatened [ST])
- American oystercatcher (*Haematopus palliatus*, ST)
- Black skimmer (*Rynchops niger*, ST)
- Snowy plover (*Charadrius nivosus*, ST)
- Florida sandhill crane (*Antigone canadensis pratensis*, ST)
- Little blue heron (*Egretta caerulea*, ST)
- Tricolored heron (*Egretta tricolor*, ST)
- Roseate spoonbill (*Platalea ajaja*, ST)
- Reddish egret (*Egretta rufescens*, ST)
- Southeastern American kestrel (*Falco sparverius paulus*, ST)
- Florida burrowing owl (*Athene cunicularia floridana*, ST)
- Florida bonneted bat (*Eumops floridanus*, Federally Endangered [FE])
- Tricolored bat (*Perimyotis subflavus*, Proposed FE)
- Everglade snail kite (*Rostrhamus sociabilis plumbeus*, FE)
- Wood stork (*Mycteria americana*, Federally Threatened [FT])
- Bald eagle (*Haliaeetus leucocephalus*)

### **Comments and Recommendations**

#### Wildlife Impact Avoidance Measures

Based on the times of day, the relatively large size of the drones, and their flight profiles, the proposed drone activities over Central and South Florida could cause avian and bat species to modify their behavior in response to the sight or sound of the vehicles. In general, many bird and bat species are typically active at dawn and dusk, including at the heights described, and therefore these activities could affect foraging and roosting movements. As an example, species that nest or roost in large flocks, such as wading birds, typically approach or leave their roosts during dawn and dusk. Also, some species, such as the Florida burrowing owl, are predated primarily by other avian species and may mistake a drone for a predatory bird and take cover. Additionally, some species, such as wading birds, shorebirds, and Florida sandhill cranes may flush or abandon their nests if flights get too close during the breeding season.

FWC staff recommends that the applicant review available resources and develop wildlife impact avoidance measures as project planning progresses. For example, FWC's Species Conservation Measures and Permitting Guidelines for both wading birds and imperiled beach-nesting birds (IBNBs) contain specific buffer distances and guidance on the proper use of drones in the vicinity of breeding, brood-rearing, roosting, and other important sites. Some available resources include:

- *Species Conservation Measures and Permitting Guidelines for the Little Blue Heron, Reddish Egret, Roseate Spoonbill, Tricolored Heron* (<https://myfwc.com/media/18634/threatened-wading-birds-guidelines.pdf>), Appendix B. Guidance for Using Unmanned Aerial Systems (UAS) Near Wading Birds
- *Species Conservation Measures and Permitting Guidelines for American Oystercatcher, Snowy Plover, Black Skimmer, and Least Tern* (<https://myfwc.com/media/29766/ibnb-guidelines.pdf>), Appendix F – Operation of Unmanned Aircraft Systems (UAS) Near Imperiled Beach Nesting Birds
- ShoreMapper for IBNBs (<https://gis.myfwc.com/shoremapper/>) provides distances to Recent Breeding sites, Critical Brood-rearing sites, and Critical Roosting sites
- FWC Imperiled Wading Bird Colony Viewer (<https://myfwc.maps.arcgis.com/apps/webappviewer/index.html?id=4929d2910c564e4e979fa0c58ac9da0c>) provides locations of colonies identified in the previous 5 years
- Audubon EagleWatch map tool (<https://cbop.audubon.org/conservation/about-eaglewatch-program>)

As an example of documented wildlife around these sites, approximately 6 rooftop nesting colony locations for listed seabirds have been documented within the 7.5-mile delivery radius around PADDCC TPA4 and 6 known wading bird colonies within 7.5 miles of PADDCC SFL3. As project planning progresses, FWC staff would appreciate continuing coordination on the above issues. FWC staff would like to meet with Prime Air staff to discuss potential impacts, available resources, and, as appropriate, develop project- and species-specific protocols to reduce the likelihood of negative impacts to wildlife during these activities.

#### Federal Species

This proposed range also contains suitable habitat or known nesting locations for the federally listed and managed species identified above, including bald eagles nests. FWC staff recommends continued coordination with the U.S. Fish and Wildlife Service (USFWS) Florida Ecological Services Office (ESO) as necessary for information regarding potential impacts to these species. The USFWS ESO can be contacted at [FW4FLESRegs@fws.gov](mailto:FW4FLESRegs@fws.gov).

FWC staff appreciates the opportunity to provide input on this project and finds it consistent with FWC's authorities under the Coastal Zone Management Act/ Florida's Coastal Management Program. For specific technical questions regarding the content of this letter, please contact Josh Cucinella at (352) 620-7330 or by email at [Josh.Cucinella@MyFWC.com](mailto:Josh.Cucinella@MyFWC.com). All other inquiries may be sent to [ConservationPlanningServices@MyFWC.com](mailto:ConservationPlanningServices@MyFWC.com).

Sincerely,

A handwritten signature in black ink that reads "Will Burnett". The signature is written in a cursive, slightly slanted style.
